# REPORT OF THE MAHADAYI WATER DISPUTES TRIBUNAL 

## INDEX

VOLUME - I

SI. No.
DESCRIPTION
PAGE NOS

1. Introduction and Constitution of Tribunal
2. Order dated 16.10 .2012 passed by the Tribunal in I.A. No. 2 of 2012 filed by the State of Goa whereby directions were given to the three States to file their respective Statements of Claims alongwith Replies and Rejoinders
3. Chronological details of the Statement of cases/claims filed by the States of Goa, Maharashtra and Karnataka, along with Replies and Rejoinders.
4. Issues originally framed by the Tribunal vide Order dated 21.8.2013.
5. Visit of the Tribunal to different sites 19-46 and the Report dated 12.02 .2014 of the Assessors on the visits of the Tribunal.
6. Order dated 04.03.2014 passed by the Tribunal in I.A. No. 19 of 2014 filed by the State of Goa for Amendment of Statement of claims and the consequential Pleadings of the Party States.
7. Order dated 01.04.2014 passed in I.A. No. 21 of 2014 filed by the State of Maharashtra for Amendment of Statement of Claims and consequential Pleadings of the Party States
8. Order dated 17.04.2014 passed in I.A. 49-52 No. 1 of 2012 filed by the State of Goa for restraining the State of Karnataka not to actually utilize or divert the water under the Kalasa-Bhandura Project.
9. Order dated 03.09.2014 passed by the Tribunal pointing out inconsistencies and discrepancies in the Pleadings of the Party States.
10. Order dated 15.04 .2015 passed by the 79-80 Tribunal in I.A. No. 29 of 2014 permitting the State of Karnataka to withdraw its application for Amendment of its Statement of Claims.
11. Details of further Amendments of their respective Statement of cases/claims by the three Party States as well as the Replies and Rejoinders thereto.
12. Order dated 06.05 .2015 passed by the 84-86 Tribunal in I.A. No. 28 of 2014 filed by the State of Goa directing the State of Maharashtra not to undertake, commence the work of gorge portion of Virdi Dam.
13. Prayers of the State of Goa 86-92
14. Prayers of the State of Karnataka

92-95
15. Prayers of the State of Maharashtra 95-99
VOLUME - II
16. Pleadings of the State of Goa 100-341

## VOLUME - III

17. Pleadings of the State of Karnataka 342-487
18. Pleadings of the State of Maharashtra

488-525
19. Re-framing/Re-casting of Issues vide 525-543 Order dated 17.07.2015.
20. Order dated 27.07 .2016 passed by the Tribunal in IAs. No. 60 of 2015 \& 66 of 2016 filed by the State of Karnataka rejecting its prayer to permit it to divert 7 tmc of water.

## VOLUME - IV

21. Details of oral evidence led by the Party States

- Oral evidence of AW-1 Shri Chetan 593-698 Pandit for the State of Goa
- Oral evidence of RW-1 Prof. A.K. 699-756 Gosain for the State of Karnataka
- Oral evidence of RW-2 Shri A.K. 757-803 Bajaj for the State of Karnataka

## VOLUME - V

Details of oral evidence led by the Party States contd...

- Oral evidence of MW-1 Shri S.N. 804-836 Huddar for the State of Maharashtra
- Oral evidence of AW-2 Shri Paresh 836-856 Porob for the State of Goa
- Oral evidence of AW-3 Dr. Shamila
- Oral evidence of AW-4 Shri 865-877 Rajendra P. Kerkar for the State of Goa
- Oral evidence of AW-5 Shri Subrai 877-913
T. Nadkarni for the State of Goa
- Oral evidence of RW-3 Shri S.M. 914-929 Jamdar for the State of Karnataka
- Oral evidence of RW-4 Shri G.M. Madegowda for the State of Karnataka
- Oral evidence of MW-2 Shri B.C. Kunjir for the State of Maharashtra

22. Evaluation of the oral evidence led by 954-955 the three Party States

- Findings on conflicting results 955-966 arrived at by the Experts relating to water availability
- Principles governing appreciation of the oral evidence given by the witnesses on Hydrology
- Evaluation of oral evidence of AW1 Shri Chetan Pandit for the State of Goa
- Evaluation of oral evidence of RW-984-1016
1 Prof. A.K. Gosain for the State of Karnataka
- Evaluation of oral evidence of RW-

1017-1030
2 Shri A.K. Bajaj for the State of Karnataka

- Evaluation of oral evidence of 1030-1039 MW-1 Shri S.N. Huddar for the State of Maharashtra
- Evaluation of oral evidence of AW-

1040-1052
2 Shri Paresh Porob for the State of Goa

## VOLUME - VI

Evaluation of the oral evidence led by the three Party States contd...

- Evaluation of oral evidence of AW- 1053-1058

3 Dr. Shamila Monteiro for the State of Goa

- Evaluation of oral evidence of AW- 1058-1066 4 Shri Rajendra P. Kerkar for the State of Goa
- Evaluation of oral evidence of AW5 Shri Subrai T. Nadkarni for the State of Goa
- Evaluation of oral evidence of RW- 1085-1093 3 Shri S.M. Jamdar for the State of Karnataka
- Evaluation of oral evidence of RW4 Shri G.M. Madegowda for the State of Karnataka
- Evaluation of oral evidence of 1103-1110 MW-2 Shri B.C. Kunjir for the State of Maharashtra

23. Decision and findings by the Tribunal on important questions.

- Prejudice

1110-1132

- Effect of deletion of paras 28 (iv)

1132-1201 and 28 (v) from Goa's complaint dated 09.07.2002.

- Findings on whether the Central

1201-1224
Water Commission Report of March, 2003 is to be treated as Report of the Central Water Commission.

- Determination of Dependability at which water availability is to be assessed.
- Decision relating to mandatory

1249-1290 requirements for project implementation.

## VOLUME -VII

Decision and findings by the Tribunal on important questions contd...

- Hydrology and Water Availability

1291-1443

- Monthly Rainfall Data for the period from June, 1901 to May, 2013

## VOLUME - VIII

Decision and findings by the Tribunal on important questions contd...

- Daily Rainfall Data for the 1501-1735 period from June, 1901 to May, 1940

## VOLUME - IX

Decision and findings by the Tribunal on important questions contd...

- Daily Rainfall Data for the period 1736-1952 from June, 1940 to May, 1976

VOLUME - X

Decision and findings by the Tribunal on important questions contd...

- Daily Rainfall Data for the period 1953-2175 from June, 1976 to May, 2013

## VOLUME - XI

Decision and findings by the Tribunal on important questions contd...

- Ecology
2176-2244
- Navigation

2245-2276
24. Determination of water requirements of the three Party States

- State of Karnataka

2277-2443

## VOLUME - XII

Determination of water requirements of the three Party States contd...

- State of Maharashtra 2444-2481
- State of Goa 2481-2545

25. Decision on issues framed for determination

- Issues Related to Data Availability 2546 and Quality of Data
- Issues Related to Hydrological 2546 Analysis and Methodology for Assessment of Water Availability
- Issues Related to Dependability 2547 for Assessment of Water Availability
- Issues Related to Water Utilization Demand of Water by the Respective States, and their Allocations

# - Issues Related to (a) Ecology, Global Warming and its Impact, and (b) Adverse Impact of Development of Water Resources on Ecology etc. 

2548

- Issues Related to Navigation 2548
- Issues Related to Effect to 2549

Deletion of Para 28(iv) and 28 (v) from Pleadings of the State of Goa

- Issues Related to Need for Prior 2549-2550 Consent of Co-basin States for Undertaking Projects/ including Projects for Diversion outside Mahadayi Basin
- Issues Related to Sharing of the 2550-2556
Water and Benefits out of the Water Allocated of Utilization Outside the Basin
- Issues Related to Adverse Impact of the Proposed Projects of the State of Karnataka on Projects of State of Maharashtra
- Issues Related to Over-the Year 2559-2562 Storage/Carry Over Storage by the Upper Riparian State
- Issues Related to Project-wise 2562-2567 Restrictions on Storages etc.

26. Need for Authority/Board for integrated planning and management of Water Resources of Mahadayi Basin

- Issues framed for Determination 2568-2578
- Modified Inter-State River Water 2579-2582 Disputes Act, 1956
- Recommendations made by Shri 2582-2585 Chetan Pandit
- Narmada Control Authority

2585-2590

- Cauvery River Authority (CRA)

2590-2592

- Cauvery Management Board

2593-2596

- Cauvery Water Regulatory 2596-2598 Committee
- Establishment of Cauvery Water 2598-2612 Management Authority
- Godavari and Krishna River 2612-2615 Management Board
- Krishna Waters Decision - 2615-2619 Implementation Board
- Bhakra Beas Management Board

2619-2621

- Vansadhara Supervisory 2621-2625 Committee
- Hon'ble Supreme Court Judgment 2625-2628 on Babhali Barrage Project reported in 1988 (7) SCC, P-303
- Important Activities Essentially 2629-2631 Required to be Undertaken for Sustainable Development of Water Resources of Mahadayi Basin
- Constitution of the Authority 2631-2640

27. Equitable apportionment of Waters of 2641-2666 Mahadayi River
28. Water Sharing Mechanism 2667-2672
29. Recommendations

- Data Observation and Data Bank

2672-2679

- Guidelines for Hydrological 2679-2686 Analysis for Assessment of Water Availability and Training for Professionals
- Suggestions for Reviewing the 2686-2691 Provisions of the Inter-State River Water Disputes Act, 1956
- Participation of Union 2691-2693 Government in the proceedings of the Tribunals

30. Award and Final Decision of the 2693-2706
Tribunal
31. Acknowledgment 2706-2711

## REPORT OF THE MAHADAYI WATER DISPUTES TRIBUNAL

$$
\frac{\text { SHORT IN DEXX }}{\underline{\text { VOLUME }- \text { VII }}}
$$

SI. No.
DESCRIPTION
PAGE NOS

1. Decision and findings by the Tribunal on important questions contd...

- Hydrology and Water Availability 1291-1443
- Monthly Rainfall Data for the 1444-1500 period from June, 1901 to May, 2013

## DECISION AND FINDINGS BY THE TRIBUNAL ON IMPORTANT QUESTIONS CONTD. ....

## HYDROLOGY AND WATER AVAILABILITY

767. The Mahadayi river is a west flowing river, which is also known as Mandovi river or Madei river in the State of Goa. It drains a total drainage area of 2032 sq.km. in the Western Ghats before falling into the Arabian Sea. Out of a total catchment area of 2032 sq.km., 375 sq.km. of catchment area lies in the State of Karnataka and 77 sq.km. in the State of Maharashtra. Rest of the Catchment area i.e., 1580 sq.km. lies within the State of Goa.
768. Three party States, namely the States of Goa, Karnataka and Maharashtra have indicated different values of water availability at different points in the Mahadayi river basin and at different dependability, through their respective Statements of Case / Statement of Claims or Affidavits of the Expert Witnesses or through the evidence of the Expert Witnesses during the course of Cross Examinations which are as under.
a. Water availability at $75 \%$ dependability and $50 \%$ dependability, is assessed, by the State of Goa for:
i. Entire Mahadayi basin i.e., for the catchment area of 2032 sq.km.
ii. Usable yield from catchment area of 1523 sq.km. (i.e., after deducting 509 sq.km. from total catchment area of 2032 sq.km. to assess the 'usable yield', which according to State of Goa is generated from an area of 1523 sq.km. only)
iii. Kotni Dam (independent catchment) with catchment area of 93.19 sq.km., Bhandura dam with catchment area of 32.25 sq.km., Bailnadi with catchment area of 32.33 sq.km., Kalasa (including Haltara and Surla diversions) with catchment area of 25.50 sq.km., Irti Diversion with catchment area of 8.78 sq.km., Irti pickup dam with catchment area of 9.91 sq.km., KatlaPalna Diversion with catchment area of 22.50 sq.km., Diggi Diversion with catchment area of 15.60 sq.km., and Viranjole Diversion with catchment area of 9.50 sq.km.
b. Water availability at $75 \%$ dependability and $50 \%$ dependability, is assessed, by the State of Karnataka for:
i. Entire Mahadayi basin i.e., for the catchment area of 2032 sq.km.
ii. Catchment area of Mahadayi basin in Karnataka territory (i.e., for catchment area of 375 sq.km.)
iii. Kalasa dam (including Haltara and Surla diversion) with catchment area of 25.50 sq.km., Bhandura dam with catchment area of 32.25 sq.km., Kotni Dam site
(including Bhandura dam catchment and diversion of Irti, Bailnadi) with catchment area of 125.44 sq.km., Kotni Dam site (independent catchment) with catchment area of 93.19 sq.km., Bailnadi dam (diversion) with catchment area of 32.33 sq.km., Irti dam (diversion) with catchment area of 8.78 sq.km., Irti Pickup Dam (Independent Catchment) with catchment area of 9.91 sq.km., Katla-Palna diversion with catchment area of 22.50 sq.km., Diggi diversion with catchment area of 15.60 sq.km., and Viranjole diversion with catchment area of 9.50 sq.km.
c. Water availability at $75 \%$ dependability, $50 \%$ dependability and also the average water availability is assessed by the State of Maharashtra for:
i. Entire Mahadayi basin i.e., for the catchment area of 2032 sq.km.
ii. Catchment area of Mahadayi basin in Maharashtra territory i.e., catchment area of 77 sq.km.
769. The Tribunal notices that the State of Karnataka and the State of Maharashtra have estimated the water availability for the entire Mahadayi basin with catchment area of 2032 sq.km. However, the State of Goa has estimated (a) the water availability for the entire Mahadayi basin with total catchment area of 2032 sq.km., and also (b) the water availability from catchment area of 1523 sq.km. The water availability from the
total catchment area has been termed as "runoff over the entire catchment" i.e., yield from the catchment area of 2032 sq.km. The State of Goa has estimated the water availability from catchment area of 1523 sq.km. i.e., after excluding an area of 509 sq.km. from the total catchment area of 2032 sq.km. It has been termed as 'Usable Yield' in his report by Shri Chetan Pandit, Expert Witness for the State of Goa.

## Exclusion of 509 sq.km. from total catchment area of 2032

 sq.km. by the State of Goa for assessment of yield of the Mahadayi basin770. From the Issue No. 10 relating to water availability, it is apparent that the State of Goa has used three different terms namely (a) annual runoff, (b) annual yield, and (c) annual safe yield. The State of Goa has used: (a) the term 'annual runoff' in respect of water availability from the entire catchment area of 2032 sq.km. of the Mahadayi basin; (b) the term 'annual yield' in respect of water availability from catchment area of 1523 sq.km. i.e., after excluding an area of 509 sq.km. from the total catchment area of 2032 sq.km. of the Mahadayi basin; and (c) the term 'annual safe yield' in respect of water availability from
catchment area of 982 sq.km. i.e., after excluding an area of 1050 sq.km. from the total catchment area of 2032 sq.km. of the Mahadayi basin.
771. Tribunal notices that Issue No. 24 framed for determination is specifically related to exclusion of an area of 1050 sq.km. from the total catchment area of 2032 sq.km. of the Mahadayi basin. Issue No. 24 reads as under.
"Issue No. 24: Does the State of Goa establish that for the purpose of estimation of water yield at different dependability, an area of 1050 sq . km. (out of total catchment area of 2032 sq. km.) is required to be excluded?"
772. The Tribunal finds that at Para 179D, pages 214 to 216 of the Statement of Case filed by the State of Goa (Volume 131), State of Goa has also raised the issue of non-inclusion of an area of 1050 sq.km. from the total catchment area of 2032 sq.km. of Mahadayi basin in the CWC Report of 2003, for the purpose of determination of $75 \%$ and $50 \%$ dependable yield. It is, however, noticed by the Tribunal that subsequently at Para 179N, page 222 (Volume 131), the State of Goa has mentioned that a Report of IIT, Bombay has assessed the catchment area to be excluded as

501 sq.km., and not 1050 sq.km as mentioned at Para 179D. The Tribunal also finds that on the other hand, Shri Chetan Pandit, in his Report of August 2016 (Volume 191), has considered 509 sq.km. as the area to be excluded to assess the water availability in the Mahadayi river basin.
773.

Shri Chetan Pandit, Expert Witness of the State of Goa has discussed the related matter under Para 15, page 55 of his Report of August 2016 (Volume 191) and has concluded as under.
> "Thus, in this case of Mandovi River basin while the total yield may be estimated for a catchment area of 2032 SqKm, usable yield has to be estimated only on the area $1523 \mathrm{Km}^{2}$ being $=2032-509 \mathrm{Km}^{2} . "$
774. The above statement of Shri Chetan Pandit, presents an entirely different scenario from what is reflected in the specific issue framed for determination i.e., Issue No. 24 which is based on averments made in Para 179E, page 217, Para 179L, page 221 and Para 179M, pages 221-222 of the Statement of Case of the State of Goa (Volume 131).
775. The issue of exclusion of a part of the catchment area for assessment of yield of the basin has not been addressed in
the Affidavits or the Reports of the Expert Witnesses of the States of Karnataka and Maharashtra.
776. On the suggestion of Shri Chetan Pandit, Expert Witness for the State of Goa, to exclude an area of 509 sq.km. from the total catchment area of 2032 sq.km. of Mahadayi basin, several questions were put to him during the cross examination by the learned Counsel of the State of Karnataka. In reply to questions No. 98 put to Shri Pandit on 3.10.2016, Shri Chetan Pandit stated as under.
> "The words I have used are "Thus, in this case of Mahadayi River Basin while the total yield may be estimated for a catchment area of 2032 Sq. Km., usable yield has to be estimated only on the area 1523 Sq. Kms. being = $2032-509 \mathrm{Km}^{2}$ ". The word "Usable" is important."

(Emphasis supplied)
777. At Para 15, pages 54-55 of his Report titled "Yield Study for Mahadayi River Basin" filed on 4.8.2016 (Volume 191), Shri Chetan Pandit has mentioned that, exclusion of a part of the catchment from the yield studies, is a standard practice and in this regard, he has cited the following cases.

- The Hon’ble Krishna Water Disputes Tribunal has allotted the yield of the Krishna basin only up to Prakasam barrage.
- The Hon'ble Narmada Water Disputes Tribunal has allotted the yield of the Narmada basin only up to the Sardar Sarovar dam site.
- The Hon’ble Cauvery Water Disputes Tribunal has allotted the yield of the Cauveri basin only up to an anicut known as the Lower Anicut.
- The Hon'ble Godavari Water Disputes Tribunal has allotted the yield of the Godavari basin only up to the Dowleshwaram anicut.

778. 

During the course of cross examination by Shri Mohan V. Kataraki, learned Counsel for the State of Karnataka, Shri Pandit admitted that excluded area in case of Krishna basin was only about $0.72 \%$ (reply to question No. 106) and that the excluded area in case of Mahadayi basin was about 25.05\% (reply to question No. 107). In reply to question No. 108 put by Shri Mohan V. Kataraki, learned Counsel for the State of Karnataka, Shri Pandit, has further stated that he had not come across a case where about $25 \%$ of the basin area was excluded from
computation of the basin yield in India. Question No. 108 and his reply thereof are reproduced hereunder.
"Q. No. 108. During your career in the Central Water Commission and as a consultant after your retirement, have you come across any other basin in India or outside India, where such a large area of $25 \%$ of the catchment was excluded from the estimation of the yield of the basin?

Ans. I have not studied any basin outside India. But within India I have not come across a case where about $25 \%$ of the area was excluded from computation of the yield. Having said that I must clarify that the percentage of area excluded is determined by the topography. Mahadayi is, to the best of my knowledge, the first instance of a Western Ghat basin which is being thus adjudicated. The Western slope of the Western Ghats is a very narrow strip. If a similar study was to be made for other Western Ghat rivers, the results would be comparable."
779. Further, in reply to Question No. 173 put by the Tribunal on 6.10.2016 on this issue, Shri Chetan Pandit, inter-alia, stated as under.
"In the Paragraph 179L and 179M of State of Goa's Amended Statement of Case, filed on 23.04.2015, there is reference to "The said Report". Perhaps this is a yield Report prepared by Prof. V. Jothiprakash. In that report
the terms run-off and yield were used in a particular manner. He used the run-off to indicate the water accruing from rainfall over the entire catchment and the term 'yield' to indicate the usable part of the runoff by excluding some part of the catchment, from where the run-off cannot be utilized for various reasons. In CWC we did not use these terms in the way he has used them. ..."
(Emphasis supplied)
780. Apart from the fact that the area not considered for the purpose of assessment of water availability of Krishna basin for apportionment among the party States, is only about 0.72\%, the Tribunal notes that the decision to assess the water availability up to Vijayawada weir by Krishna Water Disputes Tribunal I and up to Prakasham barrage by Krishna Water Disputes Tribunal II, was in view of general agreement. At Para 234 of Chapter IX on page 73 of the volume I of the Report of the Krishna Water Disputes Tribunal - I, it is stated that "it is generally agreed that the volume of water which passes over and through the Vijayawada Weir would give us a fair idea of the volume of flow in the river after the upstream utilisations are added to it". The Krishna Water Disputes Tribunal - II has also adopted the same and at page 275 of its Report, it is stated that "after considering the flow data at the terminal point viz.

Prakasham barrage, next important component to arrive at is upstream utilization".
781. From the information available at the web site of the Sardar Sarovar Narmada Nigam Limited, it is found that the total basin area of the river is $97,410 \mathrm{sq} . \mathrm{km}$. and the catchment area upto the dam site is 88,000 sq.km. Thus, the area downstream of the Sardar Sarovar dam is 9,410 sq.km. i.e., about 9.7\% of the total area of the basin. However, the exclusion of the area for the purpose of assessment of water availability of the Narmada basin was not an issue at all. The Issue No. 7 framed for determination by Narmada Water Disputes Tribunal as indicated at page 3 of the Volume I of the Report of the Tribunal is reproduced hereunder.
"7. What is the utilisable quantum of waters of Narmada at Navagam dam site on the basis of 75 per cent or other dependability and how should this quantum be apportioned among the States of Gujarat, Maharashtra, Madhya Pradesh and Rajasthan?"

Therefore, the question of exclusion of an area for the purpose of assessment of water availability of the Narmada basin does not arise.
782.

Shri Chetan Pandit has stated that the Hon'ble Cauvery Water Disputes Tribunal has allocated the yield of the Cauvery basin only up to an anicut known as the Lower Anicut. The area downstream of the Lower Anicut across Coleroon, is about $9.8 \%$ of the total catchment area of $81,155 \mathrm{sq} . \mathrm{km}$. of the Cauvery basin. In this regard, the Tribunal notes that the assessment of yield of the Cauvery basin was made by the Cauvery Fact Finding Committee constituted by the Government of India on $12^{\text {th }}$ June 1972, and the same was accepted by the Cauvery Water Disputes Tribunal. The Cauvery Fact Finding Committee has assessed the yield up to Grand Anicut. The relevant extract from page no. 72 of the Report of the Cauvery Fact Finding Committee are reproduced hereunder.

## "Grand Anicut

The figures of utilisation at the Grand Anicut for the 38 years from 1934-35 to 1971-72 have been supplied by the Government of Tamil Nadu. To these, the annual realisations, the surplus at Upper Anict for the corresponding year have been added to arrive at the realisations at Upper Anicut. For arriving at the utilisation at Lower Anicut, the difference in flow at the Lower Anicut and the releases of surplus from the Upper Anicut and the Grand Anicut is obtained and added to
the realisations at Upper Anicut. Thus the realization worked out would represent the yield from the Cauvery basin up to Grand Anicut and the yield of the Coleroon river but would exclude the runoff from the Cauvery / Vennar systems which are drained by these systems into the sea. ..."
783. Shri Chetan Pandit has stated that the Hon'ble Godavari Water Disputes Tribunal has allotted the yield of the Godavari basin only upto the Dowleshwaram anicut, excluding an area of 3545 sq.km. The area of 3545 sq.km. is only1.1\% of the total catchment area of 312812 sq.km. of the Godavari river. However, the point which is important is that, in case of Godavari, the issue of water availability was addressed in view of the several agreements among the party States. The Sub-issue No. 1 under Issue No. III reads as under.

> "(1) On what basis should the available waters be determined?"

The decision of the Godavari Water Disputes Tribunal on the Issue No. III at Para 135, page 46 of its Report, is reproduced hereunder.
"The Agreements filed by the parties have apportioned the waters of the Godavari river between them.

In the Agreement dated the $7^{\text {th }}$ August, 1978 between the States of Maharashtra, Madhya Pradesh and Andhra Pradesh, the three States have agreed to set up a duly constituted Tripartite Inter-State Control Board for Inchampalli Project inter-alia for its operation and maintenance. Except as aforesaid the Agreements filed by the parties do not provide for setting up of any machinery by the Tribunal for making available and regulating the allocations of water to the States concerned or otherwise to implement the Agreement between the parties or the decision of the Tribunal. Issue No. III (8) is disposed of accordingly.

No other question arises under Issue No. III in view of the Agreements between the parties and the Issue is disposed of accordingly."
784. From above, it is evident that the yields at terminal points have been assessed on consideration of various issues and facts and the same have been used for the purpose of apportionment of water among the party States. However, in all cases, it is clearly stated that the yield is at the terminal point,
and that in no case, the yield at such terminal point, is defined as yield from the basin. It is also noted by the Tribunal that in none of the cases, aspects related to intrusion of the saline water from the sea / ocean and its mixing with the fresh water and rendering it unfit for any human, has been cited as a reason for excluding any part of the basin for the purpose of assessment of yield. Thus, the statement of Shri Pandit that "when yield is estimated for the purpose of estimating the quantity of water available for use, it is standard practice to exclude this part of the catchment from the yield studies" is not based on fact and is factually incorrect.
785. The Tribunal finds that the yield of Drainage Basin has been defined in the IS:4410 (Part XI/Sec 2) - 1972 at para 2.66 as "Total volume or flow from a drainage basin for a long stipulated period of time, for example 'annual yield of a drainage basin' is mean annual runoff". Further, the term "yield of a river" has been clearly defined in the report of the Cauvery Water Disputes Tribunal. The very first sentence of Chapter - I of Volume III Availability of Water, of the Report of the Cauvery Water Disputes Tribunal states that "The yield of a river system is the annual virgin flows at its terminal site". In the question No. 173,

Shri Chetan Pandit was also specifically asked whether he agreed with the above mentioned definition of yield as given in the Indian Standard Code or that included in the Report of the Cauvery Water Disputes Tribunal. In his reply, Shri Chetan Pandit did not specifically convey his disagreement with the definition of yield as given in the Indian Standard Code or that included in the Report of the Cauvery Water Disputes Tribunal but linked it to the outfall point on the river. The relevant extract from his reply is reproduced hereunder.
"... In IS Codes they do not make a distinction between a tributary which meets a larger river at a specific point vis-à-vis a large river which outfalls into an ocean or sea. The river which outfalls into the sea/ocean would pass through a delta and estuarine phase, whereas a tributary has no delta, no estuary. Obviously, the definition of catchment for the purpose of allocation of utilizable yield of a river which is a tributary, for example the Yamuna, will have to be different from the definition for a river which may be small, but is an independent river out falling into a sea or an ocean. ..."
786. Shri Subrai T. Nadkarni, AW5, who is examined on behalf of the State of Goa, has stated in reply to Q.No. 19 by the learned Counsel of the State of Karnataka, that the small quantum of water available is mainly used for protective
irrigation. The Question No. 19 and the reply thereof are reproduced hereunder.
"Q.No.19. Please refer to question No. 11, and your answer thereto. I show you the statement of list of projects completed and also proposed by the State of Goa in the area of 509 Sq. Km.
(PER TRIBUNAL: The learned counsel for the State of Karnataka has handed over to the witness a statement containing "List of projects completed by Goa in the excluded Zone of 509 Sq . Km. utilising 3.305 TMC in Mahadayi basin". The statement is taken on record and is marked as MARK-KA/24.)

If the water generated in the zone of 509 Sq . Km. is not utilisable, and cannot be treated to be a part of yield, then how did Goa plan these projects?

Ans. I have gone through the list contained in the document MARK-KA/24, handed over to me, and I wish to state that many of the projects listed therein, either do not lie in the 509 Sq . Km. area, as shown in the list or some minor schemes like very small bandharas, ponds are included in the said 509 Sq. Km. zone, and I wish to state that the small quantum of water available is mainly used for protective irrigation.

I may add that the projects listed at SI. No.1, 2, 3, 5 and 7, all the lift irrigation schemes and all the water supply schemes, do not lie within the 509 Sq. Km. zone."

It becomes necessary for the Tribunal to examine the question as to what is 'protective irrigation'. The dominant design practice in irrigation engineering is, to design irrigation systems, in such a manner that water supply covers the full crop water requirements, either completely by irrigation or in addition to rainfall. The 'protective irrigation' systems are designed and operated on the principle that available water in rivers or reservoirs, has to be spread thinly over a large area, in an equitable manner. The idea is to reach as many farmers as possible, and to protect them against crop failure and famine, which would regularly occur without irrigation in regions with low and erratic rainfall. The general aim of protective irrigation translates into specific technical, organizational and socioeconomic characteristics. In technical sense, protective irrigation implies spreading water thinly into 'light crops' i.e. low water demanding, which are envisaged to be grown and water is rationed on the basis of available supplies. Thus, in water terms, it is characterized by high duties i.e. low unit water supplies and low design intensities. In protective irrigation schemes, crop water requirements of the full command area are not met, nor taken into account in the design of the scheme. Protective systems are completely supply oriented. The systems are
designed for continuous flow and automatic water distribution, implying low levels of management intensity. In an organizational sense, protective irrigation implies distributing limited amounts of water over a large number of people. To achieve this, a system of organizational arrangements has to be devised that makes farmers accept less water than is needed for the full growth of their crops, so that other farmers can also have water. In a socioeconomic sense, protective irrigation means the maximization of returns per unit of water instead of unit of land and thereby maximizing total social benefits. From a national economic perspective, protective irrigation makes sense because it maximizes agricultural output given the limited availability of water, generates more employment and spreads the benefits over a large number of producers. Thus, for the purpose of assessment of water availability for meeting the consumptive demand, the 'protective irrigation' is, same as irrigation. Schemes developed in 509 sq.km., for utilizing the water generated over the area, which also forms part of the catchment of Mahadayi Basin, plays its own role in maximizing agricultural output of light crops and benefits thereof reach to large number of farmers. Therefore, once the water generated over a piece of land, say, in this case, 509 sq. km. of land, is utilized for any beneficial use,
including protective irrigation, such land cannot be excluded from the total catchment area of Mahadayi basin, while estimating yield of Mahadayi basin.
787. From above, it is clear that the yield of a river basin cannot be defined with reference to usability of water from the consideration of its productive use for human beings, animals or agriculture. Thus, the contention of the State of Goa that, for the purpose of estimation of water yield at different dependability, an area of 509 sq.km. or 1050 sq.km. (out of total catchment area of 2032 sq. km.) is required to be excluded, is not justified. The Tribunal is of the considered view that the water availability or yield of the Mahadayi basin must be assessed on the basis of total catchment area of the river basin, viz., 2032 sq.km. Thus, issue No. 24 is answered in negative, by the Tribunal.
788. The Tribunal finds that the methodology for assessment of water availability used by all the three party States, namely Goa, Karnataka and Maharashtra and that adopted by the Expert Witnesses appearing on behalf of them are broadly same, i.e. all have used linear regression equation to assess the water availability from average rainfall over the basin
computed with the help of rainfall data of few selected rain gauge stations. However, in view of the various deficiencies noticed in the data/data processing by them, it has become important for the Tribunal to have a critical review of the values of water availability reported by the three States, either through the Statement of Case of State of Goa and State of Maharashtra / Statement of Claims of State of Karnataka or Affidavits of the Expert Witnesses or through the answers / explanations given by their respective expert witnesses, during the course of Cross Examinations.
789. In the first instance, the water availability for the entire Mahadayi basin has been examined as under:

## Water Availability Estimated by the State of Goa

790. Based upon suggestions of the State of Goa, the Issue No. 10 relating to the water availability in Mahadayi basin was framed for determination, which is reproduced hereunder.

> "10. Whether the State of Goa establishes that (a) the $75 \%$ and $50 \%$ dependable annual runoff in the entire Mandovi River Basin is 4110.79 M.cu.m (145.05 TMC)
and 4632.178 M.cu.m (163.45 TMC) respectively, (b) the $75 \%$ and $50 \%$ dependable annual yield is 3081.07 M.cu.m (108.72 TMC) and 3471.85 M.cu.m (122.51 TMC) respectively from the entire Mandovi River Basin considering the area of $1523 \mathrm{~km}^{2}$ [(2032-509) $\mathrm{km}^{2}$ ], and (c) the $75 \%$ and $50 \%$ dependable annual safe yield is 1986.61 M.cu.m (70.10 TMC) and 2238.58 M.cu.m (78.99 TMC) respectively from entire Mandovi River Basin considering the area of $982 \mathrm{~km}^{2}$ [(2032-1050) $k m^{2}$ ]."

The water availability of entire Mahadayi basin indicated in the Issue No. 10 is as under.

- Runoff over entire catchment area $=145.05 \mathrm{tmc}$ of 2032 sq.km. at $75 \%$ dependability
- Runoff over entire catchment area $=163.45$ tmc of 2032 sq.km. at $50 \%$ dependability

791. In the Table in Para 19 on page 8 of his Affidavit (Volume 191), Shri Chetan Pandit, Expert Witness of the State of Goa, has reported the results of his study. However while tendering his affidavit on 30.8.2016, Shri Chetan Pandit mentioned about a typing error and stated as under.
"... In the affidavit on page 8 at the bottom there is a table. In this table there is a typing error. The 75\% dependable yield for an area of 2032 sq.km., is shown as
3777.3 MCM and 133.4 TMC respectively. This should read 4372.4 MCM and 154.4 TMC. These figures have been inadvertently typed in the next row. Correspondingly, the 50\% dependable yield for an area of 1523 Sq. Kms. reads 4372.4 MCM and 154.4 TMC should instead read 3777.3 MCM and 133.4 TMC. An identical correction needs to be carried out in another instance of the same table at page 58 of the report, Table 34-A."

Yield reported by Shri Chetan Pandit, after incorporating the corrections suggested by him, is as under.

| Yield |  | Mcum | tmc |
| :--- | :--- | :--- | :--- |
| Runoff over entire <br> catchment. <br> Area 2032 SqKm | $50 \%$ <br> Dependable | 5039.8 | 178.0 |
|  | $75 \%$ <br> Dependable | 4372.4 | 154.4 |
| Usable Yield. <br> Catchment Area <br> 1523 SqKm | $50 \%$ <br> Dependable | 3777.3 | 133.4 |
|  | $75 \%$ <br> Dependable | 3277.2 | 115.7 |

792. However, during the course of cross examination, Shri Chetan Pandit, Expert Witness of the State of Goa in reply to question No. 154 put to him by the Tribunal on 5.10.2016 and replied by him on 6.10 .2016 , admitted that due to some software
errors found in the 2003 version of Microsoft Office, the values indicated in his Affidavit of evidence filed on 4.8.2016 (Volume 191) needed corrections, and accordingly, during reply to question No. 154, he informed on 6.10.2016 that the reassessed values of the water availability for the entire Mahadayi basin, with catchment area of 2032 sq.km were as under.

- Runoff over entire catchment area $=151.47$ tmc of 2032 sq.km. at 75\% dependability
- Runoff over entire catchment area $=175.16$ tmc of 2032 sq.km. at $50 \%$ dependability

## Water Availability Estimated by the State of Karnataka

793. The State of Karnataka, in its Statement of Claims (Volume 129), has referred to the water availability assessed by Central Water Commission and the following has been stated at Para 9.2, page 76, Volume 129.

> "... The total yield of Mahadayi upto the mouth of the river worked out in the CWC Report of 2003 is 6234

Mcum ( 220 tmc ) at 50\% dependability and 5652 Mcum $(199.60 \mathrm{tmc})$ at $75 \%$ dependability. ..."

Accordingly, as per the suggestions of the State of Karnataka, the Issue No. 34 was framed for determination as under.
"Whether the State of Karnataka establishes that the total available water for allocation amongst the basin States in the inter-State river Mahadayi and its valley is not less than 220 tmc at $50 \%$ dependability or 199.6 tmc at $75 \%$ dependability as estimated by the Central Water Commission in its reports of October 2001 and March 2003?"
794. As per Table-11, page 49 of the Report dated 12.9.2015 (Volume 166) of Prof. A. K. Gosain, Expert Witness of the State of Karnataka, the water availability of the Mahadayi basin is estimated as under.

| Case I: Computation of <br> annual yield series of | Water <br> availability at <br> Mahadayi basin for the <br> period from 1928-29 to <br> 2012-13 with regression <br> equation used in CWC's <br> Report of March 2003 | Water <br> availability at <br> $50 \%$ <br> dependability | $=$ |
| :--- | :--- | :--- | :--- |

| Case II: Computation of annual yield series of Mahadayi basin for the period from 1928-29 to 2012-13 using revised regression equation based on extended runoff data. | Water availability at 75\% dependability | $=$ | 206.14 tmc |
| :---: | :---: | :---: | :---: |
|  | Water availability at 50\% dependability | $=$ | 223.20 tmc |

## 795. As per Table-4, page 10 of the Report dated 9.5.2017

 (Volume 198) of Prof. A. K. Gosain, Expert Witness of the State of Karnataka, the water availability of the Mahadayi basin is reassessed as under.| Case I: Computation of annual yield series of Mahadayi basin by substituting the catchment | Water availability at $75 \%$ dependability | $=$ | $\begin{array}{\|l} \hline 198.42 \\ \text { tmc } \end{array}$ |
| :---: | :---: | :---: | :---: |
| rainfall ( mm ) for the monsoon period for the period from 1928-29 to 200001 in the best fit $R-R$ relation | Water availability at 50\% dependability | $=$ | $\begin{aligned} & 215.59 \\ & \text { tmc } \end{aligned}$ |
| Case II: Computation annual of Mahadayi yield series basin | Water availability at $75 \%$ dependability | $=$ | $\begin{aligned} & 202.55 \\ & \text { tmc } \end{aligned}$ |
| substituting the catchment rainfall (mm) for the monsoon period for the period from 1928-29 to 201213 in the best fit R-R relation | Water availability at 50\% dependability | $=$ | $\begin{aligned} & 216.89 \\ & \text { tmc } \end{aligned}$ |

796. Prof. A. K. Gosain, Expert Witness of the State of Karnataka on 18.5 .2017 before the start of his cross examination, further stated that he had worked out the water yield by using the R-R relationship derived after incorporating the omitted rainfall and runoff data of 1979-80, and the re-computed values of the water availability of the Mahadayi basin were as under.

- Water availability at $75 \%=206.17 \mathrm{tmc}$ dependability
- Water availability at $50 \%=223.06 \mathrm{tmc}$ dependability

## Water Availability Estimated by the State of Maharashtra

797. Issue No. 55 has been framed for determination in respect of the water availability on the suggestions of the State of Maharashtra. The Issue No. 55 is reproduced hereunder.
"Whether the State of Maharashtra proves that the contribution of Maharashtra territories to the basin flow of Mahadayi river is 200.006 Mcum at $50 \%$ dependability and 171.891 Mcum at 75\% dependability."
798. Specific values of water availability either at 75\% dependability or at $50 \%$ dependability for the entire Mahadayi basin have not been indicated in the Statement of Case filed by the State of Maharashtra.
799. Shri S. N. Huddar, Expert Witness of the State of Maharashtra has, however, examined the water availability for the Mandovi (Mahadayi) basin assessed by the various Experts and reported by them in different documents, and mentioned that the specific yield revealed by CWC study is justified. In addition, he has proposed to account for the import of water from Tillari (Chapora) basin through Tillari Irrigation Project. He has mentioned in Para 4.6, page 21 of Affidavit filed on 15.9.2015 [Volume 163(a)] that taking into account this water import, he has assessed "the availability in Mandovi basin as 5913 Mcum at $75 \%$ dependability". The water availability of 5913 Mcum at 75\% dependability is equal to 208.73 tmc .

## Highly Varying Estimates of Water Availability by Various

## Experts

800. The quantum of water availability assessed and included in different Reports varies considerably. The water availability at $75 \%$ dependability for the entire Mahadayi basin with catchment area of 2032 sq.km. as indicated in different Reports filed by the respective State Governments or by the Expert Witnesses are as under:

| SI. | Sources | Water |
| :---: | :---: | :---: |
| No. |  | Availability at |
|  | $75 \%$ |  |
|  |  | Dependability |

1. Affidavit of Shri S. N. Huddar, Expert : 208.73 tmc Witness of the State of Maharashtra (Ref: Para 799 above)
2. Statement of Prof. A. K. Gosain during : 206.17 tmc cross examination (Ref: Para 796 above)
3. Report of Prof. Gosain of September : 206.14 tmc 2015 (Ref: Para 794 above) - Case II
4. Report of Prof. Gosain of September : 204.24 tmc 2015 (Ref: Para 794 above) - Case I
5. Report of Prof. Gosain of May 2017 : 202.55 tmc (Ref: Para 795 above) Case II
6. Statement of Claims of the State of : 199.60 tmc Karnataka (Ref: Para 793 above)
7. Report of Prof. Gosain of May 2017 : 198.42 tmc (Ref: Para 795 above) Case I
8. Affidavit of Shri Chetan Pandit (Ref: : 154.40 tmc Para 791 above)
9 Statement of Shri Chetan Pandit during : 151.47 tmc cross examination (Ref: Para 792 above)
9. Statement of Case of the State of Goa : 145.05 tmc (Ref: Para 790 above)
10. The State of Maharashtra has not indicated the water availability for the Mahadayi basin as a whole, in its pleading. However, Shri S. N. Huddar, Expert Witness on behalf of the State of Maharashtra has mentioned the water availability for the entire Mahadayi river basin as 208.73 tmc at Para 6.0 on page 25 of his Affidavit filed on 15.9.2015 [Volume 163(a)]. In addition to above, Shri Subrai T. Nadkarni, Expert on behalf of the State of Goa has also undertaken sub-basin wise hydrological studies and included the result in his Report of November 2017 (Volume 208).
11. In view of highly varying values of water availability mentioned in different Reports, the Tribunal has decided to critically examine the following Reports.

- Report of Central Water Commission of 2003 (Volume 15)
- Reports of Prof. A. K. Gosain of September 2015 (Volume 66) and May 2017 (Volume 198 and Volume 198A)
- Report of Shri Chetan Pandit of August 2016 (Volume 191)
- Report of Shri S. N. Huddar of September 2015 [Volume 163(a)]
- Report of Shri Subrai T. Nadkarni of November 2017 (Volume 208)

## Critical Examination of Report of Central Water Commission of 2003 (Volume 15)

803. As already mentioned earlier, the Tribunal has no hesitation in holding that the Central Water Commission Report of March, 2003 (Volume 15) cannot be said to be a Report of the CWC. The Report has been examined from the view point of its technical contents only. The Tribunal notices that the findings of the Report of Central Water Commission of 2003 (Volume 15) were adopted by the State of Karnataka and these findings
formed the basis for its claims in respect of water availability of entire Mahadayi basin. It is also noticed by the Tribunal that Prof. A. K. Gosain, Expert Witness of the State of Karnataka, has endorsed the Report of the CWC of 2003, (Volume 15) and that the Report of Prof Gosain of September 2015 (Volume 166) is based on the methodology adopted by CWC for preparation of its Report of 2003 with additional data for the period from 1998-99 to 2012-13. This is apparent from the averments made by Prof. Gosain at Para 6, page 5 of his Affidavit filed on 15.9.2015 (Volume 166) which is reproduced as under:

> "... The present study aims at assessing the annual gross yield of Mahadayi basin on $75 \%$ and $50 \%$ dependability basis taking into account the additional hydrological and meteorological data that has become available after the CWC study was conducted in 2003 and using the standard procedures and methodologies deployed by CWC."
804. The State of Goa, in its Statement of Case (Volume 131), has raised several objections against the Report of CWC of 2003 at Paras 179B to 179D(i). The State of Goa has also highlighted a number of deficiencies in respect of data processing and methodology adopted in the Report of CWC of 2003 at Paras 179I to 179M of its Statement of Case (Volume 131).
805. Accordingly, the Tribunal has critically examined the contents of the Report of the CWC of 2003 (Volume 15), keeping in view the available information from the Statement of Case of the State of Goa (Volume 131) and that from the Statement of Claims of the State of Karnataka (Volume 129) and other related documents to ascertain as to:
a. what prompted CWC to take up the Study and finalize the Report of 2003;
b. whether the objectives of the CWC Study have been achieved;
c. whether the objections raised by the State of Goa in respect of data and procedures adopted by CWC are valid; and
d. whether the findings of CWC Study of 2003 (Volume 15) can be relied upon?
806. From the averments made by the State of Goa at Para 87, page 117 of its Statement of Case (Volume 131) and the State of Karnataka at Para 2.19, page 22 of its Statement of Claims (Volume 129), it is apparent that the process of undertaking the hydrological study of Mahadayi basin was initiated during the first inter-State meeting held under the Chairmanship of Member
(WP\&P), CWC, on 29.5.2001 which was, among others, attended by the Secretary, Government of Goa, Secretary, Government of Karnataka and Secretary, Government of Maharashtra. One of the decisions taken during the meeting was to set up the "Hydrological Study Group" comprising the Chief Engineer, Hydrology Studies Organization, CWC, representatives from the States of Goa, Karnataka and Maharashtra and a representative of National Water Development Agency (NWDA). It was decided that the Hydrology Study Group would submit its report in three months' time.
807. The first meeting of the Study Group under the chairmanship of Chief Engineer (Hydrology), CWC, New Delhi was held on 13.10.2001 at the Office of the Chief Engineer, WRD, Government of Goa, Panaji, Goa. In terms of the decision at the first Interstate meeting of 29.5.2001, it was agreed that the Interstate Study Group had to submit a Report. The Chief Engineer (Hydrology), CWC, who was the Chairman of the Study Group, did not even convene any meeting of the Interstate Study Group, much less or call for any Report. Rather, at this meeting, the Chief Engineer, CWC produced a Yield Study Report unilaterally prepared by its Hydrology Directorate, ignoring
entirely the previous decision of involving Interstate Study Group. The minutes of the first meeting of the Study Group held on 13.10.2001 were circulated vide letter dated 22.10.2001. After the receipt of the minutes of the first meeting of the Study Group, the Govt. of Goa had sent detailed comments on the unilateral study carried out by CWC vide letter dated 12.11.2001 addressed to Shri V. R. Sastry, Chief Engineer, HSO, CWC, New Delhi. A similar letter dated 13.11.2001 was also sent to Shri. S. B. Suri, Chief Engineer (HQ), NWDA, New Delhi. In response to the letter dated 13.11.2001, clarifications were received by the State of Goa from the NWDA vide their letter dated 4.1.2002. Further, the Government of Goa requested NWDA to supply the full and correct data vide letter dated 18.1.2002.
808. The second meeting of the Hydrological Study Group for the yield of Madei river basin was held on 11.1.2002 at Bengaluru, which was intimated by letter, dated 12.12.2001 enclosing agenda for the meeting. The notes were circulated by Goa in the second meeting of the Study Group at Bangalore. The following paragraphs give the outcome of the discussions which took place in the second meeting of the Hydrology Study Group.
i. Director, Hydrology $(\mathrm{S})$ requested the members to identify the rain gauge stations, which the co-basin states propose to be considered in the study. During the discussions in the first meeting, Government of Goa was of the view to consider only IMD stations. Govt. of Goa now confirmed their view that all the stations for which data is available irrespective of the agency who is maintaining the station is to be used in the analysis. Other members also agreed for the same. While raising the issue of influencing area of each stations, Director, Hydrology (S) wanted to know if certain stations below some threshold influencing area could be neglected.
ii. While discussing about the authentication of hydrometeorological data to be used in the study, Chief Engineer, Govt. of Goa, expressed the following concerns.
(a) The rainfall data for some years and some stations, which they have got directly from IMD, do not match with what has been used in the preliminary study by CWC.
(b) The discharge data at Ganjim is not consistent. The discharge varies significantly for the same gauge level.
iii. After discussing the approach to be applied to the study, it was decided that rainfall - runoff model at Ganjim can be
developed once the rainfall data and discharge data are reconciled and corrected, considering all the stations up to Ganjim.
iv. While discussing about the period for which the rainfall data is to be used for extending the rainfall-runoff model, CWC in its preliminary studies has proposed to consider the period from 1931 onwards as most of the rainfall stations were operative in this period, which give a more rational catchment rainfall value. Seventy years is sufficiently good length of series to finalize the yield studies. Government of Karnataka agreed to this proposition. However, Government of Goa insisted to consider the data for the entire period i.e., 1901 onwards irrespective of the number of stations and their period. After detailed discussion, no consensus among the participating states could be reached on the period of data to be used for developing the series. It was therefore decided that this would be discussed in the next meeting.
809. Before the Study Group could even complete the yield study, the CWC summoned the second Interstate meeting on 7.3.2002 vide letter dated 15.02.2002. However, from the
minutes of the meeting circulated vide letter dated 16.4.2002, it is evident that the meeting was actually held on 27.3.2002. The notes were circulated by Goa Team in the second inter-state meeting at New Delhi. The minutes of the second inter-state Meeting are indicated in para 36(xc) of Volume II.
810. An inter-State meeting was convened by the Union Minister of Water Resources on 20.12.2002. The meeting was attended by the Chief Minister of Goa, Minster of Major and Medium Irrigation from Karnataka among others. It was decided that the yield study should be completed by 31.3.2003, after reconciliation of the discrepancies by the officials of the Government of Goa and CWC.
811. In pursuance to the decision taken during the meeting taken by the Union Minister of Water Resources on 20.12.2002, the CWC, vide letter dated 6.3.2003 (Annex. III, page 16, Volume 15) requested the States of Goa, Karnataka and Maharashtra to depute the representatives of respective States to CWC. The CWC proposed to start the work on 10.3.2003 and informed the States that the analyses might take about 15 days.
812. CWC informed that the representatives of the NWDA and the States of Karnataka and Goa attended Central Water Commission, but the State of Maharashtra did not respond. However, CWC also reported that the representative of Goa initially attended the meeting but later on withdrew and conveyed his reservation on correctness of rainfall and discharge data and suggested for postponing the yield studies till apprehensions were allayed.
813. However, the study report titled "Study on Yield of Mahadayi Basin" was drafted in CWC in March 2003 by the Study Group consisting of members from NWDA and State of Karnataka only. Thereafter, the report was submitted to the Ministry of Water Resources by the Chairman, CWC on 10.4.2003. The Union Ministry of Water Resources, after examining the matter, directed CWC to convince Government of Goa about the data collection procedure in view of the restrictions placed by Ministry of Water Resources for supply of raw data; and to call further meeting of the engineers of the two States (i.e., Goa and Karnataka), to reach an agreement on the studies done by CWC. The record does not indicate that any steps were taken by the CWC pursuant to directions given by the Ministry of Water

Resources nor there is anything on record to show that any meeting of the engineers of the two States, was convened by the CWC or that any agreement was reached, regarding study done by CWC, between Goa and Karnataka. Thus, the studies carried out by CWC in March 2003 remained inconclusive and incomplete. In view of above, it is evident that the report titled "Study on Yield of Mahadayi River Basin" of the Central Water Commission (Volume 15) was never considered by the Hydrology Study Group. Further, there is nothing on record to establish that the said Study has been considered during the subsequent interState meetings. It is also evident that the Ministry of Water Resources has also not accepted or adopted the said Study. In view of what is stated above, the Tribunal is of the opinion that there is no CWC Report (2003) and Volume 15 produced by the State of Karnataka cannot be taken into consideration as the report of the Central Water Commission, prepared in the year 2003.
814. The Tribunal notes that there is nothing on record which mentions about objective of the preparation of the Report of CWC of 2003. It is noted that the only action on part of the Union Ministry of Water Resources was to issue the letter dated
30.4.2002 (Annexure- 24, pages 101-102 of Volume 11) to convey the in-principle clearance from water availability angle to the Government of Karnataka for diversion of 7.56 tmc from Madei basin to meet the drinking water needs of Hubli / Dharwad. Subsequently, the letter dated 30.4.2002 was kept in abeyance by the Union Ministry of Water Resources vide letter dated 19.9.2002 (Annexure-25, pages 103-104, Volume 11). The Tribunal notes that the specific action on part of the Union Ministry of Water Resources i.e., issuing the letter conveying the in-principle clearance and subsequently keeping the in-principle clearance in abeyance, was much before the drafting of the Report of CWC of 2003 and forwarding the same to the Ministry of Water Resources on 10.4.2003.
815. The Tribunal notices that, in this regard, following important points emerge.
a. The "Study on Yield of Mahadayi River basin" finalized by the Central Water Commission has not been formally considered by the "Hydrology Study Group". There is nothing on record which establishes that the "Hydrology Study Group" has applied its mind on the "Study on Yield of

Mahadayi River basin" drafted by the Central Water Commission and adopted, affirmed, agreed to, concurred with, recognized or acknowledged the same.
b. There is nothing on record to establish that the said study has been considered during subsequent Inter-State meetings, either at the level of Member (WP\&P), CWC or at the level of Union Minister of Water Resources.
c. There is nothing on record which establishes that the said study has been adopted by the Union Ministry of Water Resources for any purpose.
816. The Tribunal is of the firm view that neither the State of Karnataka nor the State of Maharashtra, is justified in treating such an inconclusive and incomplete report as that of CWC (2003) Report. Further, the Tribunal holds that different projections of water availability, made by the State of Karnataka and State of Maharashtra as well as by their respective Expert witnesses, on the basis of so called CWC (2003) report, which in fact, is not the report of CWC, in the eye of the law at all, are uncalled for and unwarranted and therefore, the same cannot be considered, by the Tribunal.
817. Four specific objections of the State of Goa, on the data used by CWC for the preparation of the Report and the methodology adopted by it, are at Paras 179B, 179C, 179D and 179D(i) of its Statement of Case (Volume 131). In addition, few other deficiencies have also been highlighted in paras 179 to 179M.
818. The Tribunal finds that the Objection 1 at Para 179B at pages 212 and 213 (Volume 131) relates to exclusion of rainfall data of Panaji Station from the year 1901 to 1927. However, it was noted that Shri Chetan Pandit, the Expert Witness of the State of Goa, himself has not used the data of Panjim Station from 1901 to 1927 in his study (Volume 191). As a matter of fact, Shri Chetan Pandit has used the data of various rain gauge stations including that of Panjim for the period from 1964 to 2005 only for the purpose of estimation of water availability. Therefore, this objection raised by State of Goa, has no substance.
819. It is noted by the Tribunal that the Objection 2 at Para 179C, pages 213 and 214 (Volume 131) pertains to use of runoff data based on discharge measurement at Ganjim Site by 'float
observation method'. It is, however, noted that Shri Pandit has himself used the same data i.e., discharge data observed by CWC using 'float observation method' after applying certain corrections, although on an erroneous assumption. This aspect has been discussed in detail while dealing with the Issue No. 6 framed for determination. Thus the objections to CWC (2003) report raised in Para 179C has also, no substance.
820. The objection 3 at Para 179D, pages 214 to 216 (Volume 131) raised by the State of Goa relates to non-exclusion of an area of 1050 sq.km. from the total catchment area of 2032 sq.km. of Mahadayi basin for the purpose of determination of $75 \%$ and $50 \%$ dependable yield. It is, however, noticed by the Tribunal that subsequently at Para 179N, page 222 (Volume 131), the State of Goa has mentioned that a Report of IIT, Bombay has assessed the catchment area to be excluded as 501 sq.km., and not 1050 sq.km as mentioned at Para 179D. The Tribunal notices that on the other hand, Shri Chetan Pandit, in his Report of August 2016 (Vol 191), has considered 509 sq.km. as the area to be deducted. This aspect of exclusion of an area of 509 sq.km. has already been discussed at paras 3 to 15 and the Tribunal is of the considered view that for the purpose of
assessment of water availability or yield of the Mahadayi basin, total catchment area of 2032 sq.km. should be taken. Therefore, the objection does not sustain.
821. The objection 4 at Para 179D (i) at page 217 (Volume 131) relates to errors in derivation of regression equation by CWC. In this regard, a similar question was put to Prof. A. K. Gosain, by the State of Goa, in respect of regression equation derived by Prof. Gosain by using the additional data. In reply to the question No. 187 put to Prof. Gosain by the learned Senior Counsel of the State of Goa on 17.5.2017, he replied as under:
"While deriving the regression equation, it is always important to understand the other conditions also. In the question No. 181 posed to me yesterday, I was told that Goa had achieved a runoff equation as below:-

$$
\text { Runoff }=0.625 * \text { Rainfall }+1278.113
$$

When I used this equation to derive the Mahadayi yield, as per the procedure and data used in CWC (2003) Report, I got a yield of 238.69 TMC at $75 \%$ dependability and 273.38 TMC at $50 \%$ dependability, which is drastically different from the yield obtained by CWC (2003) Report. I believe Goa has ignored a very important line provided in CWC (2003) Report, at pages 9-10. I quote:-
'Regression analysis has been carried out using the monsoon catchment rainfall and concurrent runoff and best fit R-R relation obtained, ignoring
inconsistent data of monsoon rainfall / runoff points as per standard practice'.
Therefore, if you do not use the proper information, while deriving the R-R relation, you are bound to get different equations. As far as my above referred equation is concerned, it has been derived by ignoring all the years with the runoff factor more than 1.0."
822. In view of above, the specific objection i.e., Objection 4 of the State of Goa does not sustain in its present form, However, the issue relating to ignoring specific data sets while deriving the rainfall runoff equation has been examined separately in subsequent Paras.
823. Even if, one assumes, for the sake of argument, that there is a CWC (2003) report, as contended by the State of Karnataka and State of Maharashtra, as well as by their respective Expert witnesses, there are serious deficiencies, drawbacks, anomalies, shortcoming, inconsistencies, in the data and processing of data, used in CWC (2003) Report, which are enumerated by the Tribunal as under.
a. The Central Water Commission, in its Report on "Consistency Analysis of Flow Data in Mahadayi Basin" (Vol
99) has concluded at Para 5.0, page 17 that 'the flow data of Ganjim G\&D site appears to be consistent and homogeneous and reliable for any water availability analysis / estimate in basin'. However, it is found by the Tribunal that for the purpose of derivation of RainfallRunoff equation in its Report of 2003 (Volume 15), CWC chose to ignore the data of 9 years out of total length of data of 19 years, which were available at the time of preparation of the Report, as is apparent from "Note on Inconsistency in the Process of Exclusion of Data Used for Development of Rainfall Runoff Relations as Adopted in the Report (2003) of CWC and the Report of September 2015 of Prof. A. K. Gosain", prepared by the Tribunal and shown to Prof. Gosain as MARK-19. The Note is reproduced hereunder:
"On the basis of limited preliminary analysis (using trial and error approach) of data included in the studies carried out by CWC [Annexure-29 of the Statement of Claims on behalf of the State of Karnataka] and the information provided by Prof. A. K. Gosain vide Exhibit KAR/RW-1/7, the following position emerges.

| SI. <br> No. | Year | Runoff factor | Information about exclusion of data in |  | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | CWC's 2003 Report using 19 years of data | Prof. Gosain's <br> Report using 34 years of data |  |
| 1 | 2 | 3 | 4 | 5 | 6 |
| 1. | 1980 | 1.35 | Excluded | Excluded |  |
| 2. | 1982 | 1.30 | Excluded | Excluded |  |

| 3. | 1988 | 1.11 | Excluded | Excluded |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 4. | 2011 | 1.11 | - | Excluded | Data for 2011 <br> not used by <br> CWC |
| 5. | 1984 | 1.09 | Excluded | Excluded |  |
| 6. | 1999 | 1.05 | - | Excluded | Data for 1999 <br> not used by <br> CWC |
| 7. | 1990 | 1.02 | Excluded | Excluded |  |
| 7. | 1983 | 1.01 | Excluded | Excluded |  |
| 8. | 1995 | 0.98 | Excluded | Not excluded |  |
| 9. | 1981 | 0.97 | Excluded | Not excluded |  |
| 10. | 1996 | 0.61 | Excluded | Not excluded |  |
| 11. | 2006 | 0.58 | - | Excluded | Data for 2006 <br> not used by <br> CWC |

From above, it is apparent that CWC excluded data set of 9 years for the study to develop linear regression equations. It is noted that the data excluded by CWC inter-alia included the data for the years 1981, 1995 and 1996 but Prof. Gosain, Expert Witness for the State of Karnataka did not exclude the data for these years and considered data for these years in his study. It also appears that data for the year 2006 with runoff factor of 0.58 has been excluded by Prof. Gosain. Obviously, there are marked variations in the procedure followed by CWC and that by Prof. Gosain."

The reasons, for not considering data of 9 years out of 19 years and ignoring 9 years of data for development of Rainfall-Runoff equation, have not been fully explained by CWC in its Report of 2003.
b. The process of filling-in the missing monthly rainfall data with monthly normal values, stated as the 'method of Normals' is not in conformity with prescribed procedures in
various documents. The report titled "Hydro-meteorology Handbook: Precipitation and Climate (May 2014)" prepared under Indian Hydrology Project (MARK-18, which was shown to Prof. A. K. Gosain), prescribes three methods, namely (a) Arithmetic Average method, (b) Normal Ratio method, and (c) Distance Power method, for filling up the gap. Similarly, in the publication No. UM-1/98-99 titled "Procedure for Systematic Processing of Rainfall Data" of National Institute of Hydrology (MARK-10), which was shown to Prof. Gosain), two methods namely (a) Normal Ratio method, and (b) Distance Power method, have been described.
c. The Tribunal finds that there are obvious mistakes of serious nature in computations as is evident from Annex-XI on page 46 of the Report of CWC of 2003 (Volume 15). At page 46 of Report of CWC of 2003 (Volume 15), the gross monsoon yields from the year 1979-80 to 1997-98 are shown to be increasing every year by 1 Mcum, which is not correct as is evident from the values indicated in Annex X, page 45 of Volume 15. Similarly, the non-monsoon yield in the $3^{\text {rd }}$ column of Annex XI is found to be increasing by 1

Mcum every year which is contrary to the values indicated in column 9 of Annex IX(a), page 42 of Volume 15. Shri A. K. Bajaj, Expert Witness of the State of Karnataka, in reply to question No. 105 (xi) put to him on 18.9.2017, by the learned Senior Counsel for the State of Goa, stated as under.
"This point was answered by me sometimes back also and it was indicated at that time also that this is a typographical error that has crept in while copying / pasting data in the excel sheet from one data set to another."

The Tribunal finds that, such justifications, for obvious errors in the computations, which have a bearing on the final outcome, are not at all acceptable, to the Tribunal at all.
d. The checks for external consistency as prescribed in the "Guidelines for Preparation of Detailed Project Reports of Irrigation and the Multipurpose Projects issued by Government of India, Ministry of Water Resources, 2010 (MARK-5) and presence of trend in the data as prescribed in the "Guidelines for rainfall-runoff modelling - Towards best practice model application" published by eWater

Cooperative Research Centre of the Australian Government. (MARK-34) and illustrated in the "Comparison Table" prepared by the Tribunal (MARK-35) were not undertaken by CWC in its report of 2003, although these are part of prescribed procedures; and appropriate corrections to account for the trend, if significant, are necessary. Non consideration, of checks for external consistency, in fact, vitiates the CWC (2003) Report.
824. Thus even if one assumes for the sake of argument that there is a Report of CWC of the year 2003, the Tribunal finds that it is full of inconsistencies, discrepancies, drawbacks and not prepared in accordance with principles relating to hydrology. Therefore, the Tribunal is of the opinion that the same is not a reliable piece of evidence.

Critical Examination of Report of Prof. A. K. Gosain of September 2015 (Volume 166) and May 2017 (Volume 198 and Volume 198A)
825. During the course of cross examination of Prof. Gosain, Expert Witness of the State of Karnataka, several inconsistencies were noted in his analyses of the data and during
the development of the rainfall-runoff model by him. Following two major flaws, are noteworthy in his analyses.
a. Although it has been stated by CWC as well as by Prof. Gosain in his Reports that the discharge data, observed by CWC at Ganjim G\&D site is consistent, data of considerable number of years are omitted for development of rainfallrunoff relation on the ground that, in such years, runoff factor is more than 1 . It is also noted that reasons for such a situation, i.e., runoff factor being more than 1 in many years, are neither investigated nor explained in the concerned Report(s).
b. While developing the rainfall-runoff model, data sets of rainfall and runoff with runoff factor very close to 1 (say, $0.98,0.97,0.94$ etc.) were, however, retained / utilized by him, without justifying the use of such data sets, in the analyses.
826. From the above, it is apparent that necessary checks were not performed on the input data used either by CWC or by Prof. Gosain, before attempting, the development of rainfall-
runoff model and applying the same, for assessing the water availability of Mahadayi basin.
827. It has also been noted that there are many inconsistencies in the rainfall data and in the processing of rainfall data by Prof. Gosain. Some of these major inconsistencies are as under:
a. Prof. A. K. Gosain has used rainfall data of ten rain gauge stations, namely, Valpoi, Ponda, Panjim, Mapuca, Sanguem, Khanapur, Kankumbi, Jamagaon, Amagaon and Castlerock in his analysis, wherein, values of rainfall of some of the rain gauge stations, appended to his two Reports i.e., Report of September 2015 (Volume 166) and Report of May 2017 (Volume 198 and Volume 198A) are very different for several years as is apparent from the following Table which is marked as from MARK-26.

| COMPARISON OF RAINFALL DATA (in mm) IN REPORTS OF 2015 AND 2017 |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

b. The Tribunal finds that, in particular, the data of rain gauge station at Castlerock appended to different reports filed by the State of Karnataka, including the two reports of Prof. A. K. Gosain, viz., the Report of September 2015 (Volume 166) and the Report of May 2017 (Volume 198 and Volume 198A) have large variations, as is apparent from the following Table which is marked as MARK-27.

| COMPARISON OF RAINFALL DATA OF CASTLEROCK (in mm) USED FOR ANALYSIS IN DIFFERENT REPORTS |  |  |  |  |  |  |

c. At Para 3(ii) on page 21 of his Report of September 2015 (Volume 166), Prof. A. K. Gosain stated that rainfall data of rain gauge Stations in and around Mahadayi basin collected / supplied by IMD were used in the analysis. It is noted that restricting the choice of rain gauge stations whose data were collected / supplied by IMD is contrary to the decision taken during the second meeting of Hydrology Study Group held on 11.1.2002, which are reproduced hereunder.
"
(i) Director, Hydrology (S) requested the members to identify the rain gauge stations, which the co-basin states propose to be considered in the study. During the discussions in the first meeting, Government of Goa was of the view to consider only IMD stations. Govt. of Goa now confirmed their view that all the stations for which data is available irrespective of the agency who is maintaining the station is to be used in the
analysis. Other members also agreed for the same. While raising the issue of influencing area of each stations, Director, Hydrology (S) wanted to know if certain station below some threshold influencing area could be neglected.
(iii) After discussing the approach to be applied to the study, it was decided that rainfall - runoff model at Ganjim can be developed once the rainfall data and discharge data are reconciled and corrected, considering all the stations up to Ganjim.

The reasons for not adhering to the decisions taken by the Hydrology Study Group have not been indicated either in the CWC (2003) Report (Volume 15) or by Prof. Gosain in his Report of September 2015 (Volume 166)
d. Further, different procedures, namely (a) Arithmetic Average method, (b) Normal Ratio method, and (c) Distance Power method have been adopted for filling-in the missing rainfall data by Prof. A. K. Gosain in his Report of September 2015 (Volume 166) and in the Report of May 2017 (Volume 198 and Volume 198A), without clearly justifying the reasons for adopting different procedures.
e. Thiessen Polygon Method has been used for estimating the average rainfall over the entire basin or the basin up to Ganjim site. However, for estimating the average rainfall, over the catchment area up to the various project sites, in State of Karnataka, the rainfall of a rain gauge station or the mean of two or three rain gauge stations by 'Arithmetic Mean Method' has been used for estimating average rainfall over the catchment area up to the project sites, as is apparent from Table 1 on page 12, Table 5 on page 16, Table 9 on page 20 and Table 10 on page 21 of Additional Affidavit of Prof. A. K. Gosain filed on 15.11.2016 (Volume 193). It is noted by the Tribunal that the reasons for selecting specific rain gauge Station or Stations for estimating the average rainfall over the catchment up to the project sites have not been explained and / or offered by Prof. Gosain.
f. Similarly, the reason for using 'observed runoff' at Ganjim, has not been explained. This is more so, in view of the fact that Prof. Gosain has chosen to ignore runoff data of 9 years out of 34 years, observed at Ganjim for development of rainfall runoff equation. It is also observed that Prof. Gosain
in his Report of November 2016 filed on 15.11.2016 (Volume 193), has used the observed runoff data of Collem gauging site for estimation of water availability at $75 \%$ dependability for two project sites, namely, Katla-Palna dam and Diggi diversion. It is, however, noted that Prof. Gosain at Para 5.1.1.4 on page 29 of his Report of September 2015 (Volume 166), has concluded that "the test shows a mixed response to the consistency checks of the flow series of Collem, therefore the station has not been used further for any detailed assessment of the basin water yield". Prof. Gosain has not explained as to why he chose to use the data of Collem gauging site for estimation of water availability at $75 \%$ dependability for two project sites namely, Katla-Palna dam and Diggi diversion, when he had already decided not to use this data further.
828. In view of above mentioned drawbacks, inconsistencies etc., it is apparent that the data, the analysis of data and the results thereof, included in the Report of September 2015 of Prof. Gosain (Volume 166) and that of May 2017 (Volume 198 and 198A) cannot be accepted or relied upon by the Tribunal.

## Critical Examination of Report of Shri Chetan Pandit of August 2016 (Volume 191)

829. It emerges from question No. 20 put to Shri Chetan Pandit, Expert Witness of the State of Goa, by the Tribunal that there are several instances of inconsistencies in the rainfall data used by him. The question No. 20 and answer thereof are reproduced hereunder.
"Q. No. 20. As per the title of the Table-2, page 15 of the Additional Affidavit filed by you on 4.1.2017, the table contains "Annual Rainfall at Stations used in the present study [Taken from the Table 31, page 90, of Document 191]. On examination of the content of the Table 31, page 90 of the Document 191, it is found that it contains the monsoon rainfall of various rain gauge stations and not the annual rainfall and that the same has been shown as annual rainfall in the Table-2 of the Additional Affidavit. This needs to be corrected.

The monsoon rainfall data of some of the rain gauge stations are included in other documents filed by the State of Goa, particularly in the "Report by the Panel of Experts" at Annexure 120 of the Document No. 31. Examination of the monsoon rainfall data provided in Annexure 12 of the Document No. 31 and that in Document No. 196 indicates that there are considerable variations in the monsoon rainfall in respect of some of
the years. A statement indicating the variation is enclosed. Some of the notable variations are as under:-
i. Data of Valpoi used by you for the year 1971 is about 62\% less;
ii. Data of Valpoi used by you for the year 1972 is about 63\% less;
iii. Data of Sanguem used by you for the year 1971 is about 67\% less
iv. Data of Sanguem used by you for the year 1972 is about 63\% less;
v. Data of Kankumbi used by you for the year 1964 is about 151\% less;
vi. Data of Kankumbi used by you for the year 1965 is about $166 \%$ less;
vii. Data of Amagaon used by you for the year 1977 is about 42\% less;
viii. There are considerable variations in almost all the years in case of Chapoli. Apparently, there is shift in the rainfall values by one year.

In this regard, please answer the following:-
a. What are the reasons for such variations in respect of the rainfall data included in the two documents filed by the State of Goa?
b. Don't you feel that reduction in the monsoon rainfall of such a high magnitude even in one or two years has potential of assessment of water availability on lower side and particularly in case of assessment of water availability at $75 \%$ dependability?

Ans. The title of the Table 2 on page 15 , should be annual monsoon rainfall and not the annual rainfall. The word monsoon is omitted which is a typographical error.
a) As regards the variation in the rainfall data for certain stations, as used by me and in the "Report BY THE PANEL OF EXPERTS", the source of the data used by the Panel of Experts in 1999 study is not known to me. However, I have reasons to believe that there were some discrepancies in the data used by various agencies before 2003. If one refers to the CWC report of 2003, which is marked Annexure 29 (Vol. 15) (Exh. KAR/66), it will be seen that para 3 at page 3 says "The rainfall data used in the study by CWC is the data collected by NWDA from IMD. There are discrepancies in this data and the data collected by Goa from IMD independently". Further at the bottom of the same page, it says that a meeting was taken by the Hon'ble Minister of Water Resources, Government of India on $20^{\text {th }}$ December 2002, and in this meeting, it was decided that the Government of Goa and CWC may make joint efforts to reconcile the discrepancies in the data and yield figures. On Page 4, the third paragraph says "...Therefore, after the Ministerial Level Meeting, it was decided by CWC to independently obtain authenticated rainfall data directly from IMD, Pune for carrying out the study".

Thus, it would be appreciated that discrepancies in the rainfall data prior to 2003 was a known fact, which is why a decision was taken to do the study again after obtaining data directly from the IMD Pune.

I do not know whether the CWC in 2003 obtained the data directly from IMD, and if so what was that data. However, sometimes in 2014, the Government of Goa obtained the data directly from IMD Pune. The data used by me is based on this data supplied by the IMD, Pune, in 2014.
b) If the data used is less than the correct data then, yes it will have an impact on the yield. However, it has not been established that the lesser data is the correct data. On the contrary the discrepancies in the data prior to 2003 was a known fact, and the IMD data, as used by me is the data supplied directly by the IMD in 2014."
830. The factual position, which emerges, from the above quoted answer is that, as regards, the variations, in the rainfall data, for certain years as used by Shri Pandit and also mentioned in the Report by the Panel of Experts, the source of data, obtained by the Panel of Experts, was not known to Shri Pandit.
831. A major and serious flaw in the procedure adopted by Shri Chetan Pandit, Expert Witness for the State of Goa, for estimation of water availability, that has been noticed by the Tribunal, relates to applying a correction factor of ' 0.84 ' (as mentioned at Para 17, page 57 of Volume 191) by Shri Chetan Pandit to the discharges observed by CWC at Ganjim site for the
period from 1979 to 2000, thereby reducing the quantum of observed runoff. This action on part of Shri Pandit was based on his assumption that the needed correction factor to convert 'surface velocity' to 'mean velocity' at the time of discharge observation by 'Float Method', was not applied by CWC while computing the daily discharges at site. However, his assumption was not based on the facts, since the 'surface velocity' was already converted into the 'mean velocity' by applying a correction factor of ' 0.89 ' by CWC, as is apparent from "Velocity Observation by Float dated 3.7.01 prepared by CWC at Site No. 25A, Ganjim" [MARK-15 (Colly)]. Hence the process of reducing the values of the annual runoff by Shri Pandit and using these reduced values of runoff for development of rainfall-runoff model is erroneous, faulty and unwarranted.
832. Obviously, the assessment of water availability of Mahadayi river basin, made by Shri Chetan Pandit, Expert Witness of the State of Goa, which is based on a model developed by him, using the runoff data modified, on the basis of erroneous assumption resulting into underestimation of runoff, cannot be considered, as reasonable and reliable. The assessment of water availability as projected by the State of Goa
and the one reported by the Expert Witness of the State of Goa in his Report, are apparently on lower side, and therefore, it is difficult by the Tribunal, to accept the same.

## Examination of Report of Shri S. N. Huddar of September 2015 [Volume 163(a)]

833. The Report of Shri S. N. Huddar, Expert Witness of the State of Maharashtra, has for all practical purposes, endorsed the findings of the Report of CWC of 2003 (Volume 15) in respect of water availability for the entire Mahadayi basin with catchment area of 2032 sq.km.
834. At Para 4.2 on page 19 of his Affidavit dated 13.9.2015 [Volume 163(a)], Shri Huddar stated that he got the rainfallrunoff relationship derived by CWC checked from his team. In this regard, the learned Advocate General of the State of Goa asked Shri Huddar as to what all was checked by him and his team. The question No. 3 put to Shri Huddar and his reply are reproduced hereunder.
"Q.No.3. Please refer to Paragraph 4.2 on page 19 of your Affidavit dated $13^{\text {th }}$ September 2015, (Vol 163a), wherein you have stated as under:-
"I have got the rainfall-runoff relationship derived by CWC, checked from my team. ..."

Could you please state what all was checked by you and your team? More specifically, did you check the following:-
a) The selection of the rainfall stations used for computing weighted rainfall at Ganjim;
b) The selection of the rainfall stations used for computing weighted rainfall for entire catchment;
c) The drawing of Thiessen polygon at Ganjim;
d) The measurement of areas of Thiessen polygon at Ganjim;
e) The computation of Thiessen weights at Ganjim;
f) The drawing of Thiessen polygon for entire catchment;
g) The measurement of areas of Thiessen polygon for entire catchment;
h) The computation of Thiessen weights for entire catchment;
i) The adding of the daily rainfall data, from IMD's files, in order to obtain the monthly rainfall data;
j) The adding of the daily runoff data, from CWC's files, in order to obtain monthly runoff data;
k) The filling of the missing rainfall data;
I) The consistency checks applied to the rainfall data; m)Any other checks applied to the rainfall data
n) The computation of the non-monsoon contribution;
o) The derivation of the regression equation;
p) The application of the regression equation to data prior to 1979, and, the preparation of estimated runoff series;
q) The determination of $75 \%$ dependable yield from the runoff series.

Could you please list, out of these, what all was checked by you and by your team?

Ans. I only checked, through the assistance of my team, the derivation of the regression equation and compared it with the equation arrived at by CWC (2003) Report, ignoring the data points for 1980 to 1984, 1988, 1990, 1995 and 1996. Before doing so, I had also checked the R-R equation without deleting the data points from 1979 to 1997 and compared both the equations so derived. In my Study annexed as Annexure 1 (Exh.MAHMW/1/1) and I have described my findings in para 9.0 to para 12.0 (pages 32-34).

The paras (a) to ( $n$ ) and (p), in the question were not checked by me and my team. Based on the monsoon rainfall figures from the CWC (2003) Report, for the years 1928 to 2000, from Annexure VIII, from CWC (2003) Report and for years 2001 to 2005 were taken from Annexure 3, the IISc Bangalore Study Document at Volume No. 86(a) and with R-R relation equation worked out the monsoon yield to which I added nonmonsoon runoff at the percentage given in CWC (2003) Report and worked out the annual yield and compared with the CWC figures.

My results for para (q) are mentioned at the end of proforma (c) to my Study at page 41."
835. From his reply, it is apparent that Shri Huddar has not examined the CWC (2003) Report properly. This is also evident from the reply of Shri Huddar to question No. 4 wherein he categorically stated as under.
"I have not scrutinized CWC (2003) Report at Volume 15 in details. The only thing I looked in this Report is the estimated yield of 5652 Mcum at $75 \%$ dependability and considered it as a reasonable estimate."

From above, it is apparent that Shri Huddar has not examined the Report of CWC with due care and therefore his conclusion at Para 20 on page 36 of his Report cannot be considered as reliable.
836. Shri S. N. Huddar at Para 6.2, page 25 of his Affidavit [Volume 163(a)] has stated that "contribution to the Mandovi basin from Maharashtra's portion is of the order of 184 Mcum and 262 Mcum at $75 \%$ and average dependability respectively which may be considered for allocation purpose".
837. The procedure adopted by Shri Huddar for estimation of water availability of Mandovi (Mahadayi) basin, from Maharashtra's portion of the Mahadayi catchment appears to be broadly in order.
838. However, the Tribunal finds that, Shri Huddar has not taken up any independent study, for assessment of water availability of the entire Mahadayi basin. In reply to question No.

12, put to him by the Tribunal on 14.11.2017, Shri Huddar has stated as under.
"Q.No.12. (At the commencement of this question, we have shown three documents to the witness, as follows:
i. Relevant pages from the book titled "Introduction to Linear Regression Analysis (Third Edition) by Douglas C. Montgomery, Elizabeth A. Peck and G. Geoffrey Vining". The same is taken on record and is marked as MARK-31.
ii. Relevant pages from the publication titled "Chapter A3 Statistical Methods in Water Resources by D.R.Helsel and R.M.Hirsch of Book4, Hydrologic Analysis and Interpretation" of the United States Geological Surveys (USGS). The same is taken on record and is marked as MARK-32.
iii. Relevant pages from the publication titled "Training module \#SWDP-37 - How to do hydrological data validation using regression" prepared under Hydrology Project by DHV

Consultant BV \& Delft Hydraulics. The same is taken on record and is marked as MARK-33.)

We find that you have adopted a simple linear equation to represent the Rainfall-Runoff relation in respect of Mahadayi basin, and you have estimated the parameters of the simple linear equation i.e., 'slope' and 'intercept' by using a computer programme on linear regression. It is, however, not clear from your Report [Vol. 163 (a)], whether you have examined the various assumptions related to linear regression and satisfied yourself about validity of these assumptions before proceeding ahead with development of simple linear equation for Mahadayi basin at Ganjim site. We also note that you have used the criteria of $\mathrm{R}^{2}$ only for testing the model adequacy.

Relevant extract from the book titled "Introduction to Linear Regression Analysis (Third Edition) by Douglas C. Montgomery, Elizabeth A. Peck and G. Geoffrey Vining" (MARK-31) are reproduced hereunder:-
"The major assumptions that we have made thus far in our study of regression analysis are as follows:

1. The relationship between the response $y$ and the regressors is linear, at least approximately.
2. The error term $\varepsilon$ has zero mean.
3. The error term $\varepsilon$ has constant variance $\sigma^{2}$.
4. The errors are uncorrelated.
5. The errors are normally distributed.

Taken together, assumptions 4 and 5 imply that the errors are independent random variables. Assumption 5 is required for hypothesis testing and interval estimation.

We should always consider the validity of these assumptions to be doubtful and conduct analyses to examine the adequacy of the model we have tentatively entertained. The types of model inadequacies discussed here have potentially serious consequences. Gross violations of the assumptions may yield an unstable model in the sense that a different sample could lead to a totally different model with opposite conclusions. We usually cannot detect departures from the underlying assumptions by examination of the standard summary statistics, such as the $t$ or $F$ statistics, or $R^{2}$. These are "global" model properties, and as such they do not ensure model adequacy."

Yet another important aspect relates to 'Validation of Regression Model'. In this regard, relevant extract from the above mentioned book are reproduced hereunder:-
"Regression models are used extensively for prediction or estimation, data description, parameter estimation, and control. Frequently the user of the regression model is a different individual from the model developer. Before the model is released to the user, some assessment of its validity should be made. We distinguish between model adequacy checking and model validation. Model adequacy checking includes residual analysis, testing for lack of fit, searching for high-leverage or overly influential observations, and
other internal analysis that investigate the fit of the regression model to the available data. Model validation, however, is directed towards determining if the model will function successfully in its intended operating environment.

Since the fit of the model to the available data forms the basis for many of the techniques used in the model development process (such as variable selection), it is tempting to conclude that a model that fits the data well will also be successful in the final application. This is not necessarily so. For example, a model may have been developed primarily for predicting new observations. There is no assurance that the equation that provides the best fit to existing data will be a successful predictor. Influential factors that were unknown during the modelbuilding stage may significantly affect the new observations, rendering the predictions almost useless. Furthermore, the correlative structure between the repressors may differ in the model-building and prediction data. This may result in poor predictive performance for the model. Proper validation of a model developed to predict new observations should involve testing the model in that environment before it is released to the user."

These aspects are also highlighted in the "Chapter A3Statistical Methods in Water Resources by D.R. Helsel and R.M. Hirsch of Book 4, Hydrologic Analysis and Interpretation" of the United States Geological Surveys (USGS) (MARK-32) Detailed procedures are also described in the publication titled "Training module \# SWDP-37 - How to do hydrological data validation using
regression" prepared under Hydrology Project by DHV Consultant BV \& Delft Hydraulics. In particular, relevant extract from Para 9.3, page 228 of "Chapter A3 Statistical Methods in Water Resources by D.R. Helsel and R.M. Hirsch of Book 4, Hydrologic Analysis and Interpretation" of the USGS (MARK-32) is reproduced hereunder: -

## "9.3 Building a Good Regression Model

A common first step in performing regression is to plug the data into a statistics software package and evaluate the results using $R^{2}$. Values of $R^{2}$ close to 1 are often incorrectly deemed an indicator of a good model. This is a dangerous, blind reliance on the computer software. An $R^{2}$ near 1 can result from a poor regression model; lower R ${ }^{2}$ models may often be preferable. Instead of the above, performing the following steps in order will generally lead to a good regression model. ..."

Various steps i.e. steps 1, 2, 2a, 2b, 2c, 3, 3a, 3b, 3c, 3d, and 4 are described at pages 228 to 237 of the "Chapter A3 - Statistical Methods in Water Resources by D.R. Helsel and R.M. Hirsch of Book 4, Hydrologic Analysis and Interpretation" of the USGS.

In this regard, please answer the following:
a. Whether you undertook studies to satisfy yourself that a simple linear equation would be most appropriate rainfall-runoff model, particularly in view of various assumptions related to linear regression analysis, and validity of the same in case
of data related to rainfall and runoff up to Ganjim site of Mahadayi basin? If yes, please indicate the relevant pages of your Report where these aspects have been discussed. If no, why such important aspects were not considered by you?
b. Why did you rely upon $\mathrm{R}^{2}$ value alone and did not carry out necessary investigations essentially required for finding the best fit equation?
c. Whether you undertook studies related to validation of the Regression Model? If yes, please indicate the relevant pages of your Report where these aspects have been discussed. If no, why such important analysis was not considered necessary?

Ans. The point-wise answers are as under:
a. While preparing my affidavit, my approach, as far as reliance by the State of Maharashtra on CWC (2003) Report is acceptable or otherwise and hence I have not gone into the detailed study to satisfy whether a simple linear equation is appropriate or otherwise. I had just used the data from CWC and checked the regression equation they have developed is in order or not. After deleting the inconsistent runoff factor figures, I verified the equation and since they were nearly the same, I concluded that Maharashtra's reliance is acceptable.
b. As stated to answer to (a) above, I have not investigated further details, but just to check the regression analysis.
c. No, I did not undertake studies related to validation of the regression model."
839. In view of above position, the recommendations of Shri S. N. Huddar for adopting the yield estimated by CWC in its Report of 2003 is found to be completely erroneous and cannot be accepted by the Tribunal.
840. From aforesaid Paras, it is apparent that neither the assessment of water availability by the State of Goa, which apparently is on lower side nor the assessment of water availability by the State of Karnataka which is on higher side nor the recommendations of the State of Maharashtra in respect of yield of Mahadayi river basin, can be considered to be valid and are not accepted by the Tribunal.
841. Therefore, it becomes necessary for the Tribunal to undertake independent study to arrive at a rational estimate of the water availability of the Mahadayi river basin.
842. As a first step, the Tribunal considers it necessary to undertake independent analysis of the data made available by the respective State Governments to satisfy about the consistency of the data or otherwise and decide whether such data could be used for independent analysis.

## Examination of Report of Shri Subrai T. Nadkarni of November 2017 (Volume 208)

843. Shri Subrai T. Nadkarni, witness on behalf of the State of Goa, in his Report of November 2017 (Volume 208), has also included the results of his study on sub-basin wise water availability for various sub-basins, namely, Ragada, Khandepar, Kotrachi, Valvanti, Bicholim, Assnora, Surla, Siquerim, Kudnem and Madei stem. Shri Subrai T. Nadkarni has stated that the availability of water sub-basin wise has been extended based on the hydrology study done by Shri Chetan Pandit. He has further, stated that the present exercise is just a computation of the water availability sub-basin wise based on extension of hydrology study by Shri Chetan Pandit. The result of the study of Shri Subrai T. Nadkarni are summarized in Table 13 at page 65 of his Report of November 2017 (Volume 208).
844. Table on page 42 of the Report of November 2017 of Shri Nadkarni (Volume 208) indicates mean annual flows for various sub-basins. In Table 13 on page 65, the $75 \%$ dependable yield of various sub-basins are shown. The Tribunal notes that the values of mean annual flow and the values of $75 \%$ dependable yield are same of all the sub-basins. The values of mean annual flow and the values of $75 \%$ dependable yield cannot be the same. Obviously, there are some errors.
845. It is noted that in Table 13, Shri Nadkarni has also indicated the total water availability as 3283.3 Mcum (115.9 tmc). The Tribunal notes that the corresponding value of water availability indicated in the Report of Shri Chetan Pandit (Volume 191) is 3277.2 Mcum ( 115.7 tmc), which was subsequently modified by Shri Pandit as 3214.70 Mcum (113.5 tmc) during the course of reply to question No. 154. It is noted that Shri Nadkarni has not indicated as to why he considered it necessary to compute the water availability at 75\% dependability for the total catchment by summing up the water availability at $75 \%$ dependability of various sub-basins. Shri Nadkarni has also not explained the reason for variation from the value arrived at by Shri Pandit. However, in reply to question No. 3, Shri Nadkarni
stated that he had carried out the arithmetic by adding up the $75 \%$ dependable figure to find overall excess / deficiency and that he agreed that the overall $75 \%$ dependability would be as evaluated by Shri Chetan Pandit, and he stood by the result of 113.5 tmc for the whole basin assessed by Shri Pandit. The question No. 3 and the reply of Shri Nadkarni are reproduced hereunder.
"Q.No.3. In the Table at Para 30, pages 14-15 and in the Table 13, page 65 of your Affidavit dated 14.11.2017 (Vol. 208), you have indicated the sub-basin wise availability of water (in Mcum) at 75\% dependability in the second column.

It is noted that the total availability of water at 75\% dependability has been shown as 3283.30 Mcum, which is equal to 115.9 tmc after conversion from Mcum to tmc.

Why have you undertaken sub-basin wise assessment of water availability at $75 \%$ dependability and to sum up to arrive at a new yield figure for the Mahadayi basin?

Ans. I had carried out the arithmetic by adding up the $75 \%$ dependable figure to find overall excess/deficiency. However, I agree that for the whole basin, the overall $75 \%$ dependability will be the effect of 13 Stations, as evaluated by Shri Chetan Pandit, and I stand by his result of 113.5 TMC for the whole basin.

I took up sub-basin study as I wanted to evaluate as to what would be the effect of availability and demands in each sub-basin."
846. In view of above, result obtained by Shri Nadkarni in respect of water availability from the catchment area of 1523 sq.km. at $75 \%$ dependability becomes redundant for all purposes.

## Critical Examination of Consistency of Observed Discharge Data

847. The Tribunal notices that the Expert Witnesses of the State of Goa and the State of Karnataka have used the observed discharge data of CWC site at Ganjim. Although, Shri Chetan Pandit, the Expert Witness of the State of Goa has highlighted several deficiencies in the process of observation of data at Ganjim in paras 9(e), 9(f), 9(g), and 9(h) on pages 48-49 of his report (Volume 191), he has used the same data after applying a correction, based on his assumption that CWC did not apply the necessary correction for converting the 'surface velocity' measured through 'Float Observation Method' into the 'mean velocity'. The Tribunal notes that his assumption was not based
on facts. Further the method used for arriving at the 'correction factor' is not in accordance with the procedure prescribed at Para 5.2 of Bureau of Standards (BIS) Code "IS 3911:1994, Surface Floats - Functional Requirements" [MARK - MAH2 (Colly)] and at Para 7.2.5.1 and Para 7.2.5.2 of BIS Code "IS 1192:2013 Hydrometry - Measurement of Liquid Flow in Open Channels using Current-meters or Floats" (MARK-14). The relevant paragraphs of "IS 3911:1994, Surface Floats - Functional Requirements" are reproduced hereunder.
" 5.2 In the selected reach, measurements shall be made at as near a stage as possible by current meter, preferably by the integration method according to IS 1192:1981, and the coefficient for obtaining the mean velocity in the vertical worked out for the float. In the absence of a more reliable figure a reduction coefficient of 0.85 may be adopted.

> NOTE - The reduction coefficient generally vary from 0.79 to 0.92 . This reduction coefficient is not a constant even for a particular channel, since it varies with depth, slope, and relative roughness of the channel boundary. It may also be obtained from Von Karman's logarithmic velocity distribution law."

The relevant paragraphs of "IS 1192:2013 - Hydrometry Measurement of Liquid Flow in Open Channels using Currentmeters or Floats" are also reproduced hereunder.

## "7.2.5.1 Method

The float velocity shall be determined by dividing the distance between the cross-sections by the time taken by the float to travel this distance. Several measurements of the float velocities shall be taken and the mean of these measurements shall be multiplied by the appropriate coefficient to obtain the mean velocity in the segment. The coefficient derived from currentmeter measurements at the site at a stage as near as possible to that during the float measurement may be used for converting the float velocity to mean velocity.

### 7.2.5.2 Surface float

Where it is not possible to check the coefficient directly, it may be assumed for guidance that, in general, the coefficient of the surface float varies between 0.84 and 0.90 depending upon the shape of the velocity profile. The higher values are usually obtained when the bed is smooth, but values outside this range may occur under certain circumstances."
848. On the other hand, Prof. A. K. Gosain, the Expert Witness of the State of Karnataka has considered, the observed discharge data of CWC site at Ganjim as correct, but still he chose to ignore data of 9 years out of 34 years without undertaking detailed investigations as to why these data should be considered as inappropriate and should be brushed aside, for the purpose of
further analysis. Surprisingly, none of the Experts i.e., Shri Chetan Pandit or Prof. A. K. Gosain had made any effort to examine and use the discharge data observed by the three States namely, the State of Goa, the State of Karnataka and the State of Maharashtra.
849. With a view to independently examining whether the observed discharge data of CWC site at Ganjim can be considered as wholly reliable, the Tribunal has made an effort to compare the observed discharge data of CWC site at Ganjim with the data observed and filed by the respective States.
850. The various States have filed the observed discharge data, of the following sites.
a. Data observed by the State of Karnataka at Chapoli site for the years 1980 and 1983 to 1991 and that from 2000-01 to 2011-12
b. Data observed by the State of Maharashtra at Virdi site for the period from 1986-87 to 2004-05 and from 2006-07 to 2011-12
c. Data observed by the State of Goa at Daucond site for the period from 2010 to 2013
d. Data observed by the State of Goa at Khadki site for the period from 2010 to 2012
e. Data observed by the State of Goa at Kudchire site for the period from 2009 to 2013
f. Data observed by the State of Goa at Paikul site for the period from 2009 to 2013
851. However, the data observed by the State of Goa for the Gauging Stations, namely, Daucond, Khadki, Kudchire and Paikul are relatively of shorter duration of 3 to 5 years only.
852. It is further noted by the Tribunal that there are inconsistencies in the data reported by the State of Goa. Shri Chetan Pandit, Expert Witness of the State of Goa was asked about the inconsistencies in the data of the Stations maintained by the State of Goa. In reply to question No. 163 put to him, by the Tribunal, on 6.10.2016, Shri Chetan Pandit stated that the data was not reliable and that the observation procedure was yet to stabilize. Question No. 163 and the reply thereof are reproduced hereunder.
"Q-163: Information culled out from the data submitted by Central Water Commission (vide report titled "Consistency Analysis of Flow Data in Mahadayi Basin" filed on 1.12.2014) and that by the State of Goa (vide Exhibit ' $B$ ' of the report titled "Submission of the State of Goa in Compliance with Paragraph 4 of the Order dated 3.9.2014 passed by this Honourable Tribunal" filed on 22.12.2014) are presented hereunder.

| Year | Annual runoff <br> at Ganjim site <br> of CWC (in <br> mm) | Annual runoff at sites <br> maintained by the State <br> of Goa (in mm) |  |
| :---: | :---: | :---: | :---: |
|  | Khadki | Kudchire |  |
| 2010-11 | 4327 | 4459 | - |
| $2011-12$ | 5961 | 8361 | - |
| $2012-13$ | 3941 | 6497 | 1952 |
| $2013-14$ | - | 8348 | 2966 |

We note that there are wide variations in annual runoff (in terms of depth in mm ) at different sites. In particular, the variations in the annual runoff (in mm ) in respect of Khadki and Kudchire sites maintained by the State of Goa during the years 2012-13 and 2013-14 are on very high side. Obviously, such variations are not acceptable.

## What are your comments?

Ans. I have not analysed the data at any station beyond 2005 and also I have not analysed the data at Khadki and Kudchire for any duration and therefore, I am not able to explain the variation at this point of time. I have been
given the data along with the question. I will analyse the same during the evening and report the outcome tomorrow."
853. On 7.10.2016, Shri Pandit stated further as under.
"I was asked to comment on the annual runoff for the years 2010-11 to 2013-14 as Khadki and Kudchire discharge observation sites maintained by the State of Goa. I have examined the same. The Khadki site is located on the main river Mahadayi approximately 7 KMs, upstream of the Ganjim site. There are no major diversion works between Khadki site and Ganjim site. Therefore, there is no logical reason for the flow at Khadki to be more than the flow at Ganjim. The flow at Khadki for the years referred above is not only more than the flow at Ganjim, but in 2011-12 and 2012-13, it is significantly more. Therefore, in my opinion, this data is not reliable.

The Kudchire site is located on river Bicholim which is a tributary of Mahadayi and meets the main river Mahadayi downstream of Ganjim site. Therefore, the flow observed at Kudchire cannot be compared to flow observed at Ganjim site. One way to form an opinion about the flow observed at Kudchire site is by comparing it with the rainfall in its catchment for the years concerned. This data is not readily available and, therefore, at this moment no opinion can be expressed about the reliability of data at this site.

I was informed by the WRD Goa Engineers that both these sites have been newly established under the

# Hydrology Project and, perhaps in 2010 to 2014, the observation procedure was yet to stabilize." <br> (Emphasis supplied) 

854. In view of above position, the data for the aforesaid gauging Stations filed by the State of Goa, have not been considered by the Tribunal for the purpose of comparison with the observed discharge data of CWC site at Ganjim.
855. The Tribunal also notices that the data of Chapoli site submitted by the State of Karnataka for the years 1980 and from 1983 to 1991, have been furnished by the State of Karnataka as "Annexure - B (Colly) - Observed Hydrological Data of Gauging at Kotni Dam Site" [Volume 98(a)]. Data are in the form of data sheets observed by site officials, with missing records of observations on considerable number of dates. The observed discharge data during the monsoon period of five months (i.e., 153 days of June to October) are found to be only for 5 days in 1980, 44 days in 1983, 85 days in 1984, 102 days in 1985, 93 days in 1986, 79 days in 1987, 74 days in 1988, 90 days in 1989, 91 days in 1990 and 118 days in 1991. Therefore, it is not considered appropriate, by the Tribunal to use such data even for the limited purpose of comparison by the Tribunal.

## 856. The annual runoff data of the following three sites

## are, however, examined and presented in Table-1.

Table-1: Comparison of Reported Observed Rainfall Data - Data of Ganjim, Khadki, Kudichire, Chapoli and Virdi in millimeters (mm) and Data of Daucond and Paikul in million cubic meters (Mcum)

| Year | Runoff at CWC <br> Site at <br> Ganjim $\begin{gathered} (\mathrm{CA}= \\ 880 \\ \text { sq.km. }) \end{gathered}$ | Khadki <br> Site of <br> State <br> of Goa | Daucond Site of State of Goa | Kudchire Site of State of Goa | Paikul <br> Site of <br> State of Goa | Chapoli <br> Site of State of Karnataka (CA $=124.4$ sq.km.) | Virdi Site of State of <br> Mahara- <br> shtra (CA $\begin{aligned} & =35.43 \\ & \text { sq.km.) } \end{aligned}$ | Remarks |

| 1997-98 | 4227 |  |  |  |  |  | 3688 |  |
| 1998-99 | 3288 |  |  |  |  |  | 3413 |  |
| 1999-00 | 4457 |  |  |  |  |  | 2895 |  |
| 2000-01 | 3627 |  |  |  |  | 2535 | 2331 |  |
| 2001-02 | 2767 |  |  |  |  | 2149 | 3064 |  |
| 2002-03 | 2674 |  |  |  |  | 2269 | 1899 |  |
| 2003-04 | 2935 |  |  |  |  | 2240 | 2416 |  |
| 2004-05 | 3028 |  |  |  |  | 2901 | 2370 |  |
| 2005-06 | 4328 |  |  |  |  | 4640 |  |  |
| 2006-07 | 4946 |  |  |  |  | 4746 | 4931 |  |
| 2007-08 | 5649 |  |  |  |  | 4451 | 5174 |  |
| 2008-09 | 4478 |  |  |  |  | 3474 | 4717 |  |
| 2009-10 | 3433 |  |  |  | 321 | 3251 | 1647 |  |
| 2010-11 | 4327 | 4459 | 1063 |  | 440 | 2639 | 3197 |  |
| 2011-12 | 5961 | 8361 | 1043 |  | 772 | 3686 | 3435 |  |
| 2012-13 | 3941 | 6497 | 1090 | 1952 |  | 2206 |  |  |

| $2013-14$ |  | 8348 | 1544 | 2966 |  | 3184 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Total | 134141 | 27665 |  | 4918 |  | 63704 | 81291 |  |
| Average | 3949 | 6916 |  | 2459 |  | 3034 | 3252 |  |

The result of the analysis carried out by the Tribunal are summarized as under.
a. Average annual runoff at Ganjim (on : 3949 mm the basis of 34 years of data i.e., from 1979-80 to 2013-14)
b. Average annual runoff at Chapoli (on : 3034 mm the basis of 14 years of data i.e., from 2000-01 to 2013-14)
c. Average annual runoff at Virdi (on : 3252 mm the basis of 25 years of data i.e., from 1986-87 to 2004-05 and from 2006-07 to 2011-12)
857. The Tribunal finds that obviously, the runoff observed at Ganjim Site is, on relatively very high side. However, since the periods of observed data at the three Sites are different, the comparison must be termed as inappropriate. Therefore, the data of concurrent periods for the three Sites, as referred to above, were also compiled by the Tribunal. The annual runoff data of the three sites for the concurrent period are presented in Table-2.

Table-2: Comparison of Reported Observed Runoff Data at Different Sites (in mm) of Concurrent Period

| Year | Runoff at <br> CWC Site at <br> Ganjim (CA = <br> 880 sq.km.) | Chapoli Site of <br> State of <br> Karnataka (CA $=$ <br> 124.4 sq.km.) | Virdi Site of <br> State of <br> Maharashtra <br> (CA = 35.43 <br> sq.km.) |
| :---: | :---: | :---: | :---: |
| 1 | 2 | 3 | 4 |
| $2000-01$ | 3627 | 2535 | 2331 |
| $2001-02$ | 2767 | 2149 | 3064 |
| $2002-03$ | 2674 | 2269 | 1899 |
| $2003-04$ | 2935 | 2240 | 2416 |
| $2004-05$ | 3028 | 2901 | 2370 |
| $2006-07$ | 4946 | 4746 | 4931 |
| $2007-08$ | 5649 | 4451 | 5174 |
| $2008-09$ | 4478 | 3474 | 4717 |
| $2009-10$ | 3433 | 3251 | 1647 |
| $2010-11$ | 4327 | 2639 | 3197 |
| $2011-12$ | 5961 | 3686 | 3435 |
| Total | 43827 | 34341 | 35182 |
| Average | 3984 | 3122 | 3198 |

The results are summarized as under.
a. Average annual runoff at Ganjim (on : 3984 mm the basis of 11 years of data i.e., from 2000-01 to 2004-05 and 2006-07 to 2011-12)
b. Average annual runoff at Chapoli (on : 3122 mm the basis of 11 years of data i.e., from 2000-01 to 2004-05 and 2006-07 to 2011-12)
c. Average annual runoff at Virdi (on the : 3198 mm basis of 11 years of data i.e., from 2000-01 to 2004-05 and 2006-07 to 2011-12)
858. From the above, it is apparent that the average annual runoff at Ganjim Site, arrived at, on the basis of observed discharge data at the Hydrological Observation Station of CWC at Ganjim, is on higher side. This position is in contradiction with, the rainfall pattern, which is reported by the State of Goa as well that by the State of Karnataka as elaborated in the following Paras.
859. At Para 1.2, pages 1-2 of the Report titled filed as "Exhibit A to the Submissions of the State of Goa in compliance with Paragraph - 4 of the Order dated 03/09/2014 passed by this Tribunal (Water Yield Studies for Mandovi River Basin - a linear
regression approach)" [Exhibit GOA-148] [Volume 101(a)] the following has been stated.
"... Goa has a tropical monsoon climate and the region is generally warm and humid. The temperature ranges from $20^{\circ} \mathrm{C}$ to $34^{\circ} \mathrm{C}$. The humidity is high throughout the year. The state receives an average annual rainfall of about 3200 mm . The rainfall occurs mostly due to orographic frontal process, as a result of the orographic influence the rainfall increases progressively from the coast to the Western Ghats. ..."
860. Prof. A. K. Gosain, Expert Witness of the State of Karnataka in his Report titled "The Yield Study of Mahadayi Basin" filed as Annexure - B to his Affidavit dated 12.9.2015 [Exhibit KAR-RW1/2] (Volume 166) has stated as under in Para 2, at page 18.
> "The basin receives major portion of its rainfall during the south west monsoon season. Over 90 percent of rainfall is received during four months of monsoon from June to September. However, there is a significant variability in the rainfall across the basin. The normal rainfall in the basin varies from 2950 mm near seashore to about 5400 mm in the upper reaches of the basin."
861. The Tribunal is of the considered view that from the aforesaid quoted paras, the discharge data observed at Hydrological Observation Station of CWC at Ganjim, cannot be relied upon.
862. It is noted by the Tribunal that neither the State of Goa nor the State of Maharashtra has raised any issue relating to inconsistency or non-reliability of the discharge data observed at Chapoli gauging site of the State of Karnataka. However, it is also observed that even the State of Karnataka has not used the discharge data observed at Chapoli. Further, the catchment area up to Chapoli site is only about 124.4 sq.km., which is relatively much lesser as compared to the total area of Mahadayi basin of 2032 sq.km., and therefore, the use of data at this site for development of Rainfall-Runoff model, to be used for assessment of water availability for the entire basin, is not considered appropriate and is accordingly not considered.
863. It is also noted by the Tribunal that the State of Goa and the State of Karnataka have not raised any issue about inconsistency or non-reliability of the discharge data observed at Virdi gauging site of the State of Maharashtra. However, the
catchment area up to this site, is still lower. The catchment area up to Virdi gauging site is only 35.43 sq.km. against the total catchment area of 2032 sq.km. of the entire Mahadayi basin river basin, and it is not safe to rely upon such discharge data, for the assessment of availability of water.
864. In view of above position, neither the observed discharge data at the Hydrological Observation Station of CWC at Ganjim nor the discharge data observed by the State of Goa at the four gauging Stations, namely Daucond, Khadki, Kudchire and Paikul nor the data observed by the State of Karnataka at Chapoli gauging Site nor the data observed by the State of Maharashtra at Virdi gauging Station, are found appropriate, by the Tribunal, for assessment of the water availability for the entire Mahadayi river basin or for development of a RainfallRunoff model to be used, for water availability assessment, for the entire Mahadayi river basin.

## Critical Examination of Consistency of Rainfall Data

865. The issues relating to consistency of rainfall data have been discussed at length during the course of examination of the
issues raised for determination as well as during the examination of the Reports which have been filed by the State of Goa or by the State of Karnataka.
866. From perusal of the information provided in various documents filed by the party States, the Examinations-in-Chief and cross examinations of the Expert Witnesses of party States, on the subject of hydrology and water availability, some inconsistencies in the rainfall data and its processing, have been noticed by the Tribunal which are summarized as under.
a. Choices of different sets of rain gauge stations for assessment of average rainfall: 10 rain gauge stations, namely, Amagaon, Jamagaon, Kankumbi, Ponda, Valpoi, Sanguem, Gawali, Chapoli, Krishnapura, and Kotni dam have been selected by Shri Chetan Pandit, Expert Witness of Goa, for assessing the average rainfall over the catchment up to Ganjim site. On the other hand, Prof. A. K. Gosain, Expert Witness of Karnataka has selected only 7 rain gauge stations, namely, Amagaon, Jamagaon, Kankumbi, Ponda, Valpoi, Khanapur, and Castlerock for assessing the average rainfall over the catchment up to Ganjim site. Thus only five
rain gauge stations, namely, Amagaon, Jamagaon, Kankumbi, Ponda and Valpoi are found to be common in the two lists. For assessing the average rainfall of the entire Mahadayi basin, Prof. A. K. Gosain considered 12 influencing rain gauge stations (Ref: Para 7.3.2, page 41, Volume 166) for varying period from 1928-29 to 2012-13, whereas Shri Chetan Pandit has considered data from 13 rain gauge stations. Similarly, there are variations in the choice of rain gauge stations for assessing the average rainfall over the catchment area of different proposed project sites. This is apparent from the following Table.

| Proposed project <br> sites | Rain gauge <br> stations selected <br> by Prof. Gosain <br> (Vol. 193)Rain gauge <br> stations selected <br> by Shri Pandit <br> (Vol. 195) <br> Bhandura dam <br> Chapoli, Gavali <br> and Jamagaon <br> Kotni dam site <br> (independent <br> catchment) <br> Jamagaon <br> Irti pick-up dam <br> (independent <br> catchment) <br> Chapoli and Gavali <br> diversion <br> Castle Rock <br> Chapogaon, <br> Chapoli, Gavali <br> and Kotni |  |
| :--- | :--- | :--- |
| Diggi diversion | Castle Rock | Sanguem |

| Viranjole <br> diversion | Castle Rock | Jamagaon, Valpoi <br> and Krishnapura |
| :--- | :--- | :--- |

b. Selection and use of varying length of rainfall data: Though the Tribunal has rejected CWC (2003) Report, as unreliable, it is noticed, just for the sake of mention that, the Report of CWC of 2003 (Volume 15), rainfall data of 70 years i.e., from 1928-29 to 1997-98, have been used. In the Report of Prof. A. K. Gosain of August 2015 (Volume 166), he has used the rainfall data of 85 years i.e., from 1928-29 to 2012-13, whereas Shri Chetan Pandit, in his Report of August 2016 (Volume 191) has used the rainfall data of only 42 years i.e., from the 1964 to 2005.
c. Variations in the values of rainfall at same rain gauge station as reported in two different documents filed by the same State: There are variations in the rainfall data of some years in respect of Rain Gauge stations at Valpoi, Sanguem, Kankumbi, Amagaon and Chapoli in two Reports filed by the State of Goa, i.e., the Report of the Panel of Experts (Annexure-120 in Volume 31) and the Report of Shri Chetan Pandit, Expert Witness of the State of Goa (Volume 196). The variations in the values of the rainfall data in two Reports are indicated in the following Tables.

Comparison of Monsoon Rainfall of Valpoi and Sanguem Raingauge Stations in Different Documents furnished by the State of Goa

Comparison of Monsoon Rainfall of Chapoli Raingauge Station in Different Documents furnished by the State of Goa

| Year | Chapoli Raingauge Station |  |  | Remarks |
| :---: | :---: | :---: | :---: | :---: |
|  | As per <br> Table-2, <br> Page 15, <br> Vol.-196 | As per Proforma 5.19, page 101 of Report of Panel of Expert, | Variation between <br> Col. 14 <br> and Col. <br> 15 (in \%) |  |

|  |  | Vol.II |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 2 | 3 | 4 | 5 |
| 1965 | 4375.0 | 1309.0 | 70.08 | Apparently, there is shift in the rainfall values by one year. |
| 1966 | 1309.0 | 610.0 | 53.40 |  |
| 1967 | 610.0 | 3619.0 | -493.28 |  |
| 1968 | 3619.0 | 1335.0 | 63.11 |  |
| 1969 | 1335.0 | 1601.0 | -19.93 |  |
| 1970 | 1601.0 | 1646.0 | -2.81 |  |
| 1971 | 1646.0 | 1034.0 | 37.18 |  |
| 1972 | 1034.0 | 1322.0 | -27.85 |  |
| 1973 | 1322.0 | 1594.0 | -20.57 |  |
| 1974 | 1594.0 | 1587.0 | 0.44 |  |
| 1975 | 1587.0 | 3123.0 | -96.79 |  |
| 1976 | 3123.0 | 4336.0 | -38.84 |  |
| 1977 | 4336.0 | 1625.0 | 62.52 |  |
| 1978 | 1625.0 | 4547.0 | -179.82 |  |
| 1979 | 4547.0 | 4197.0 | 7.70 |  |
| 1980 | 4197.0 | 5509.0 | -31.26 |  |
| 1981 | 5509.0 | 5691.0 | -3.30 |  |
| 1982 | 5691.0 | 7592.0 | -33.40 |  |
| 1983 | 7592.0 | 3902.0 | 48.60 |  |
| 1984 | 4002.0 | 7312.0 | -82.71 |  |
| 1985 | 7312.0 | 5328.0 | 27.13 |  |

Similarly, there are variations in the rainfall data reported in two different reports, namely Report of 2015 (Volume 166) and Report of 2017 (Volume 198) of Prof. A. K. Gosain, Expert Witness of the State of Karnataka as highlighted at Para 54(a) and Para 54(b).
d. Use of different methods of filling-in the missing data: Just for the sake of mention, it is stated that, Central Water Commission, in its Report of 2003, has used the 'Method of Normals', whereas Shri Chetan Pandit, Expert Witness of the Sate of Goa has used the 'Normal Ratio Method' and

Prof. A. K. Gosain, Expert Witness of the State of Karnataka has also used the 'Normal Ratio Method' for filling-in some of the missing data. However, it is noted that the procedure for filling the missing rainfall data has been described in the "Hydro-Meteorology Handbook: Precipitation and Climate" prepared under Indian Hydrology Project of Ministry of Water Resources, River Development and Ganga Rejuvenation (MARK-18), are as under.
"Normal ratio - applied if the average annual rainfall of the station under consideration differs from the average annual rainfall at the neighbouring stations by more than $10 \%$. The erroneous or missing rainfall at the station under consideration is estimated as the weighted average of the data at the neighbouring stations. The rainfall at each of the neighbouring station is weighted by the ratio of the average annual rainfall at the station under consideration and average annual rainfall of the neighbouring station. The rainfall for the missing or the erroneous value at the station under consideration is estimated as:

$$
\mathrm{P}_{\text {test }}=\frac{1}{M}\left(\frac{\text { Ntest }}{\text { Nbase } 1} \mathrm{P}_{\mathrm{base} 1}+\frac{\text { Ntest }}{\text { Nbase } 2} \mathrm{P}_{\mathrm{base} 2}+\right.
$$

$$
\left.\frac{\text { Ntest }}{\text { Nbase } 3} \mathrm{P}_{\text {base } 3}+\cdots+\frac{\text { Ntest }}{\text { Nbase. } M} \mathrm{P}_{\text {base. }}\right)
$$

Where, $\quad N_{\text {test }}=$ annual average rainfall at the station under consideration
$N_{\text {base }}$ i $=$ annual average rainfall at the adjoining stations (for $\mathrm{i}=1$ to M )

A minimum of three neighbouring stations should generally be used for obtaining good estimates using the normal ratio method."

The document titled "Hydro-Meteorology Handbook: Precipitation and Climate" prepared under Indian Hydrology Project of Ministry of Water Resources, River Development and Ganga Rejuvenation was shown to Prof. A. K. Gosain and is marked as MARK-18.

In this regard, relevant extract from "Handbook of Applied Hydrology by Ven Te Chow" (which was also shown to Prof. A. K. Gosain and is marked as MARK-11) is also reproduced as under.
"3. Interpolation of Rainfall Records. Frequently, records of rainfall for a certain station are missing for a day or several days, especially for cooperative stations. In order not to lose valuable information, it is desirable to have techniques for estimating the amounts for such days in calculating monthly and annual totals. The U.S. Weather Bureau [22] uses two procedures for these estimations, both based on simultaneous records for three stations as close to and as evenly spaced around the station with missing records as possible: (1) if the normal annual precipitation at each of these stations is within 10 per cent of that for the station with missing records, a simple arithmetic average of the precipitation at the three stations is used for the estimated amount. (2) If the normal annual precipitation at any of the three stations differs from that of the station with missing
records by more than 10 per cent, the normal-ratio method is used. This method consists of weighting, by the ratios of the normal-annual-precipitation values,

$$
\mathrm{P}_{\mathrm{x}}=\frac{1}{3}\left(\frac{N x}{N A} \mathrm{P}_{\mathrm{A}}+\frac{N x}{N B} \mathrm{P}_{\mathrm{B}}+\frac{N x}{N C} \mathrm{P}_{\mathrm{C}}\right)
$$

Where, $N$ is the normal annual precipitation. It is readily seen that the second method is adaptable to regions where there is large orographic variation in the precipitation. The two procedures have been adapted to machine methods and are used routinely by the Weather Bureau."

It is observed that both the references suggest the use of data of at least three neighbouring Rain Gauge Stations.

It is observed that the prescribed procedure has not been followed.
e. Use of different methods of computing average rainfall: Thiessen Polygon method has been used for estimation of average rainfall over the entire catchment area of Mahadayi basin as also for the catchment area up to Ganjim site. However, for estimation of average rainfall over the catchment area of the most of the identified project sites, Arithmetic Mean method, has been used by the Expert Witnesses of the States of Goa and Karnataka.
f. Non-application of all required consistency checks: Checks for the presence of trend in the long term rainfall data series have also not been applied either by the Expert Witness of the State of Goa or by the Expert Witness of the State of Karnataka. Similarly, checks for external consistency have also not been applied by them.
867. In view of above, and particularly in view of variations in the values of the rainfall of a Station, in numerous cases in different Reports, it is not considered appropriate, by the Tribunal to use the rainfall data reported by the States in the Reports filed by them.

## Assessment of Water Availability of Mahadayi Basin by the Tribunal using an Independent Approach

868. In view of highly varying values of the assessment of water availability of the Mahadayi basin as reported by the party States and the deficiencies noticed in the process of assessment, none of the assessments being acceptable, it has become necessary for the Tribunal, to make assessment of water availability of Mahadayi basin, independently.
869. The Tribunal has adopted the following approach.

## Rainfall Data to be Used

870. Since the rainfall data reported and used in different Reports filed by the States of Goa and Karnataka and by their respective Expert Witnesses were not found acceptable, the Tribunal decided to use the "High Spatial Resolution ( $0.25^{\circ} \times 0.25^{\circ}$ ) Long Period Daily Gridded Rainfall Data", which is processed by India Meteorological Department (IMD).
871. In this regard, it is noted that Prof. A. K. Gosain, has prepared a Report titled "Analysis to check the Consistency of Rainfall data in and around Mahadayi River Basin" which has been filed by the State of Karnataka along with "Further Response of the State of Karnataka to the Brief Note Handed over to the Hon'ble Tribunal at the Hearing on 11.02.2015 Read with Orders dated 03.9.2014 and 12.02.2015" (Volume 122). In the above said Report, following has been stated.
> "Recently, a new product of India Meteorological Department, in the form of high resolution gridded daily rainfall data ( $0.25^{\circ} \times 0.25^{\circ}$ resolution), derived using quality controlled station data (http://www.imd.gov.in/doc/nccraindata.pdf) has come into being which is supposed to be a much better product due to reanalysis, has been used here for consistency analysis. ..."
872. It is further noted by the Tribunal that the annual / yearly rainfall data for eight Gridded Points namely (a) $73^{\circ} 45^{\prime} \mathrm{E}$ $15^{\circ} 30^{\prime} \mathrm{N}$, (b) $73^{\circ} 45^{\prime} \mathrm{E} 15^{\circ} 45^{\prime} \mathrm{N}$, (c) $74^{\circ} \mathrm{E} 15^{\circ} 15^{\prime} \mathrm{N}$, (d) $74^{\circ} \mathrm{E} 15^{\circ} 30^{\prime} \mathrm{N}$, (e) $74^{\circ} \mathrm{E} 15^{\circ} 45^{\prime} \mathrm{N}$, (f) $74^{\circ} 15^{\prime} \mathrm{E} 15^{\circ} 15^{\prime} \mathrm{N}$, (g) $74^{\circ} 15^{\prime} \mathrm{E} 15^{\circ} 30^{\prime} \mathrm{N}$, and (h) $74^{\circ} 15^{\prime} \mathrm{E} 15^{\circ} 45^{\prime} \mathrm{N}$ for the period from 1979 to 2011, were included in the above said Report in Table 1 on page 15 of Volume 122.
873. With a view to independently examining and checking the annual rainfall data at different Gridded Points, included in the above said Report (Volume 122), the Tribunal requested the National Climate Centre, India Meteorological Department, Pune to supply the 'High Resolution ( $0.25^{\circ} \times 0.25^{\circ}$ ) Daily Gridded Rainfall Data' vide letter No. 4/27/2015/MWDT/109/377 dated 17.9.2015.
874. 

India Meteorological Department supplied a CD of "daily gridded $0.25^{\circ} \times 0.25^{\circ}$ rainfall data (1901-2013)" vide its letter No. NCC/Product/6/2014/4362 dated 22.9.2015 to the Tribunal.
875. From the Report of the India meteorological Department, received along with the data, it is noted by the Tribunal that India Meteorological Department has computed values of the rainfall at the Grid Points, after taking into consideration, all the data in and around the Grid Points, with due consideration to all aspects. Relevant extract from the publication titled "Development and Analysis of a New High Spatial Resolution ( $0.25^{\circ} \times 0.25^{\circ}$ ) Long Period (1901-2010) Daily Gridded Rainfall Data Set over India" of the National Climate Centre, India Meteorological Department are reproduced hereunder.
"In this study, as a part of IMD's efforts to make use of all the available quality rain gauge data over the country to prepare a high resolution daily rainfall data set for various applications such as climate variability \& climate change studies, validation of model rainfall at various scales, hydrological modelling, drought monitoring etc., development of a new daily gridded rainfall data set
over India at a spatial resolution $0.25^{\circ} \times 0.25^{\circ}$ for 110 years (1901-2010) have been discussed. The data set was prepared using the daily rainfall data from all the rain gauge stations over the country available in the IMD archive. ..."
876. In view of above features, Prof. A. K. Gosain, Expert Witness of the State of Karnataka was asked a question by the Tribunal on 13.7.2017. The Question No. 17 and the answer thereof are reproduced hereunder.
"Q.No.17. In your report titled "Analysis to Check the Consistency of Rainfall Data in and around Mahadayi River Basin" [Annexure A of "Further Response of the State of Karnataka to the Brief Note handed over to the Hon'ble Tribunal at the Hearing on 11.2.2015 (read with Orders dated 3.9.2014 and 12.2.2015)" - Vol. 122"] filed by the State of Karnataka on 15.4.2015, following has been stated: -
"Recently, a new product of India Meteorological Department, in the form of high resolution gridded daily rainfall data $\left(0.25^{\circ} \times 0.25^{\circ}\right.$ resolution), derived using quality controlled station data (http://www.imd.gov.in/doc/nccraindata.pdf) has come into being which is supposed to be a much better product due to reanalysis, has been used here for consistency analysis. Location of these grid points in and around the Mahadayi basin has been shown in Figure 2.

Therefore, under present situation, it is decided to use a recent product of India Meteorological Department, in the form of high resolution gridded daily rainfall data $\left(0.25^{\circ} \times 0.25^{\circ}\right.$ resolution), derived using quality controlled station data ....."

However, in the report titled "The Yield Study of Mahadayi Basin" submitted as Annexure-B of your Affidavit, you have not used the data contained in the new product of India Meteorological Department, in the form of high resolution gridded daily rainfall data which in your opinion is much better product.

Please explain the reasons for not using a much better product. Please also tell us whether the high resolution gridded daily rainfall data included in the new product of India Meteorological Department (which in your opinion is much better product) should be invariably used for development of rainfall runoff models and if not, the reasons therefor."
"Ans. I personally feel that the gridded daily rain fall data, as provided by the IMD, is more suitable for the end users, since it is a processed rain fall data, checked for most of the possible errors. However, in the present case, since it was a matter of difference of opinion between the parties, I did not want to bring in another parameter, as to the authenticity of the gridded data itself, since I know that it is an end product of interpolation, of the available actually observed rain fall, and transformed on to a uniform grid of $0.25^{\circ} \times 0.25^{\circ}$ by IMD. Therefore, having started in that direction, and submitting one Report of consistency of the gridded
data, as given along with this question, I decided to use the actual rain gauge stations for my analysis."
877. Thus Prof. Gosain has asserted and informed the Tribunal that the gridded daily rain fall data, as provided by the IMD, is more suitable for the end users, since it is a processed rain fall data, checked for most of the possible errors.
878. From above, the Tribunal concludes that the daily gridded $0.25^{\circ} \times 0.25^{\circ}$ rainfall data of the India Meteorological Department can be safely considered alongwith other data relied upon by the party States for the assessment of the availability of water of Mahadayi basin. Further, use of this data would certainly lead to convergence, at least, in respect of rainfall data.
879. It is worth noticing that, despite full knowledge about the availability of such processed daily rainfall data by India Meteorological Department, none of the three States chose to use this data nor referred to in their respective written submissions.
880. In view of above, in order to facilitate the learned Senior Counsels of the party States, to examine the daily gridded
$0.25^{\circ} \times 0.25^{\circ}$ rainfall data and offer their comments, a soft copy of the data as procured by the Tribunal from India Meteorological Department, was made available to them for their study. Learned Senior Counsels of the party States were directed to indicate as to: (a) why the daily gridded $0.25^{\circ} \times 0.25^{\circ}$ rainfall data of the India Meteorological Department has not been used by the State; (b) why the daily gridded $0.25^{\circ} \times 0.25^{\circ}$ rainfall data of the India Meteorological Department cannot be used for the assessment of yield of Mahadayi basin; and (c) whether it would be possible for the State to use the daily gridded $0.25^{\circ} \times 0.25^{\circ}$ rainfall data of the India Meteorological Department and re-assess the water availability before the conclusion of arguments by the learned Senior Counsel / learned Counsel of the party States i.e., before 22.2.2018.
881. In response, the State of Goa as well as the State of Karnataka have used the daily gridded $0.25^{\circ} \times 0.25^{\circ}$ rainfall data to: (a) develop the regression equations; and (b) re-assess the water availability. The regression equation developed by the State of Goa is "Runoff $=0.7904 *$ Rainfall -219.619 " and produced the same before the Tribunal (Volume 237-D). The regression equation developed by the State of Karnataka is " $\mathrm{Y}=$
0.981X - 269.2", where $Y$ is runoff in $m m$ and $X$ is rainfall in mm (Volume 238A).
882. The State of Goa has, however, stated at page 11 of the "Para-wise Reply of the State of Goa to the Points Raised on 09.02.2018 by this Hon’ble Tribunal regrading Inconsistency in the Rainfall Data" (Volume 237D) as under.
"Goa does not agree with Prof. Gosain that the grid data can be used to check the consistency of the station data. Dr. S Pai, is the Scientist F and Head, Climate Prediction, Climate Research Division, IMD. A paper by him and his colleague was included in the grid data handed over by this Hon'ble Tribunal. Goa wrote an email to Dr. Pai regarding use of this data. The query sent, and Dr. Pai's reply are enclosed. It is clear that if sufficiently long series of station data is available, and in Mahadayi it is thus available, then station data is the better option. Grid data is useful for situations where adequate station data is not available."
883. The Tribunal finds that the reply of Dr. S. Pai to the email sent to him by Shri Chetan Pandit (which has been enclosed by the State of Goa), is as under.
"... If you have long times series of good quality stations data, this may better than gridded data. At the same time you can use both and compare the results for common period and if they match well you can use gridded data as the same is available from 1901 onwards."
[Emphasis supplied]
884. What is worth noticing is that Shri Pai has made very specific reference to good quality station data. The main reason for the Tribunal for not accepting the data of various rain gauge stations included in different reports filed by the party States, is the inconsistencies noticed in the station data and not the length of the data. Obviously, the data with such inconsistencies cannot be regarded as "good quality stations data".
885. Accordingly, the Tribunal has decided to use the "High Spatial Resolution ( $0.25^{\circ} \times 0.25^{\circ}$ ) Long Period Daily Gridded Rainfall Data" from IMD. The data supplied by IMD includes daily processed rainfall values at various Grid Points for the years from 1901 to 2013. After due examination, the Grid Points in and around the Mahadayi river basin were selected as the Grid Points which are located on west of the Sahayadri Hill Ranges are used for the assessment of the water availability of Mahadayi basin. In
view of orographic features, the Grid Points on the east of the Sahayadri Hill Ranges were not considered being in the rain shadow area.
886. Seven Grid Points i.e. (a) $74^{\circ} \mathrm{E} 15^{\circ} 15^{\prime} \mathrm{N}$, (b) $74^{\circ} 15^{\prime} \mathrm{E}$ $15^{\circ} 15^{\prime} \mathrm{N}$, (c) $73^{\circ} 45^{\prime} \mathrm{E} \quad 15^{\circ} 30^{\prime} \mathrm{N}$, (d) $74^{\circ} \mathrm{E} \quad 15^{\circ} 30^{\prime} \mathrm{N}$, (e) $74^{\circ} 15^{\prime} \mathrm{E}$ $15^{\circ} 30^{\prime} \mathrm{N}$, (f) $73^{\circ} 45^{\prime} \mathrm{E} 15^{\circ} 45^{\prime} \mathrm{N}$ and (g) $74^{\circ} \mathrm{E} 15^{\circ} 45^{\prime} \mathrm{N}$ are thus selected. The location of the selected seven Grid Points, vis-à-vis, the catchment area of Mahadayi river basin are shown in Fig. 1.

## Analysis of the Data to Assess the Average Annual Rainfall over the Basin

887. The daily rainfall values at the seven Grid Points are used by the Tribunal to compute the monthly values of the rainfall, which were further added to estimate the values of the annual rainfall for each year starting from year 1901-02 to 201213.
888. Annual average rainfall over the Mahadayi basin has been computed by using the Thiessen weight of the seven Grid Points and the annual average rainfall over the entire Mahadayi river basin with catchment area of 2032 sq.km. has, accordingly, been computed by the Tribunal and the annual values for 112 years from 1901-02 to 2012-13 are given in Table-3.

Table-3: Estimation of Average Annual Rainfall over Mahadayi River Basin

| Year | Annual Rainfall (in mm) at Grid Points in Mahadayi Basin |  |  |  |  |  |  | Average |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} 74^{\circ} \mathrm{E} \\ 15^{\circ} 15^{\prime} \mathrm{N} \\ \text { (Thiessen } \\ \text { Weight = } \\ 0.0317 \text { ) } \end{gathered}$ | $\begin{gathered} \hline 74^{\circ} 15^{\prime} \mathrm{E} \\ 15^{\circ} 15^{\prime} \mathrm{N} \\ \text { (Thiessen } \\ \text { Weight = } \\ 0.1470 \text { ) } \end{gathered}$ | $\begin{gathered} 73^{\circ} 45^{\prime} \mathrm{E} \\ 15^{\circ} 30^{\prime} \mathrm{N} \\ \text { (Thiessen } \\ \text { Weight = } \\ 0.0566 \text { ) } \end{gathered}$ | $\begin{gathered} 74^{\circ} \mathrm{E} \\ 15^{\circ} 30^{\prime} \mathrm{N} \\ \text { (Thiessen } \\ \text { Weight = } \\ 0.2704 \text { ) } \end{gathered}$ | $\begin{gathered} 74^{\circ} 15^{\prime} \mathrm{E} \\ 15^{\circ} 30^{\prime} \mathrm{N} \\ \text { (Thiessen } \\ \text { Weight = } \\ 0.4218 \text { ) } \end{gathered}$ | $\begin{gathered} 73^{\circ} 45^{\prime} \mathrm{E} \\ 15^{\circ} 45^{\prime} \mathrm{N} \\ \text { (Thiessen } \\ \text { Weight = } \\ 0.0043 \text { ) } \end{gathered}$ | $\begin{gathered} 74^{\circ} \mathrm{E} \\ 15^{\circ} 45^{\prime} \mathrm{N} \\ \text { (Thiessen } \\ \text { Weight = } \\ 0.0682 \text { ) } \end{gathered}$ | Annual <br> Rainfall <br> (in mm) for Entire Mahadayi Basin <br> (2032 <br> sq.km.) - <br> Using <br> Thiessen <br> Weights for Grid Points |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| 1901-02 | 2356.9 | 2262.1 | 2544.2 | 3610.9 | 2409.0 | 3115.2 | 4085.6 | 2835.8 |

## Length of the Data to be used for Analysis

889. The Tribunal notices that varying length of data sets have been used in different Reports by the Experts for the purpose of development of Rainfall-Runoff model i.e., the linear regression equation and for generation of runoff series to be used for assessment of water availability, at different dependability, of the Mahadayi river basin.
890. Though the Tribunal has decided not to utilize the CWC Report of 2003, limited information in respect of length of data, used for analysis is mentioned, only for the purpose of examining the length of the data necessary for assessment of water availability. In the Report of CWC of 2003 (Volume 15), the rainfall and runoff data set of 10 years i.e., for the years 1979-80, 1985-86 to 1987-88, 1989-90, 1991-92 to 1994-95 and 1997-98, have been used for development of Rainfall-Runoff model and rainfall data of 70 years, (from 1928-29 to 1997-98) have been used for generation of runoff series to assess the water availability of the Mahadayi river basin at 75\% dependability and 50\% dependability.
891. In the Report of Prof. A. K. Gosain of August 2015 (Volume 166), the rainfall and runoff data set of 25 years i.e., for the years 1979-80, 1981-82, 1985-86 to 1987-88, 1889-90, 199192 to 1998-1999, 2000-01 to 2005-06, 2007-08 to 2009-10, and 2012-13, have been used for development of Rainfall-Runoff model and rainfall data of 85 years (from 1928-29 to 2012-13), have been used for generation of runoff series to assess the water availability of the Mahadayi river basin at $75 \%$ dependability and 50\% dependability.
892. In the Report of Prof. A. K. Gosain of May 2017 (Volume 198 \& 198A), the rainfall and runoff data set of 34 years (from 1979-80 to 2012-13) have been used for development of Rainfall-Runoff model and rainfall data of 85 years (from 1928-29 to 2012-13), have been used for generation of runoff series to assess the water availability of the Mahadayi river basin at 75\% dependability and 50\% dependability.
893. Shri Chetan Pandit, in his Report of August 2016 (Volume 191) has used the rainfall and runoff data set of 27 years (from 1979 to 2005) for development of Rainfall-Runoff model and rainfall data of 42 years (from the 1964 to 2005) have been
used for generation of runoff series to assess the water availability of the Mahadayi river basin at 75\% dependability and 50\% dependability.
894. Shri S. N. Huddar, Expert Witness of the State of Maharashtra in his Report of September 2015 [Volume 163(a)] has not used the rainfall data. Instead, he has used the runoff series derived on the basis of the observed discharge data at Virdi Gauging Station of the State of Maharashtra, for 25 years (from 1986 to 2004 and from 2005 to 2011) for assessment of (a) water availability at 75\% dependability, (b) water availability at 50\% dependability and (c) average annual water availability for the Maharashtra portion only.
895. Thus, the Experts have used different length of data (a) varying from 10 years to 34 years for development of RainfallRunoff model, and (b) varying from 25 years to 85 years for generation of runoff series to assess the water availability at different dependabilities.
896. The Tribunal has noticed that none of the Reports filed by the States have undertaken the studies in respect of
external consistency checks and that related to checking the presence of trend in the data series and applied the corrections to address the presence of trend, wherever necessary. In this regard, Shri S. N. Huddar, was asked question No. 13 regarding the trend analysis and need for applying corrections for trend by the Tribunal on 14.11.2017. The specific question and answer to the question by Shri Huddar are reproduced hereunder.

## "Q.No.13.

a. Why necessary investigations, particularly those related to trend analysis in the data, were not undertaken by you before development of RainfallRunoff Equation and accepting the same as correct?
b. Keeping in view the presence of rising trend in the rainfall data, would it be appropriate to use the past data i.e., data for the period from 1928 to 1978 without applying necessary corrections for the same?

Ans. Para wise reply is as under:
(a). As already stated in answer to previous question, I have restricted my scope to checking of the equation developed by the CWC, and hence, no independent investigation was done by me.
(b). At present Hydrologists use the past record to the extent, which is readily available. Of course, it would be desirable to use the data after applying necessary correction for the same."
897. The Tribunal finds that the "Guidelines for Preparation of Detailed Project Reports of Irrigation and Multipurpose Projects" of the Government of India, Ministry of Water Resources published in 2010 provides for use of a maximum of 40 years of data for hydrological studies. The document "Guidelines for Preparation of Detailed Project Reports of Irrigation and Multipurpose Projects" of the Government of India, Ministry of Water Resources published in 2010 was shown to both Shri Chetan Pandit as well as Prof. Gosain during their cross examination and is marked as MARK-5. Regarding the length of the data, specific question was also put to Prof. Gosain by the Tribunal. The question No. 33 and the reply thereof are reproduced hereunder.
"Q.No.33. The Chapter II of the "Guidelines for Preparation of Detailed Project Report of Irrigation and Multipurpose Projects", of the Ministry of Water Resources, already on record as MARK-5, and a copy of which has already been handed over to you, suggests the time unit and length of the data required for hydrological analysis. For a complex system, the minimum length of data required for simulation has been suggested as 40 years. We find that at the time of preparation of your Report, observed hydrological data of about 34 years were available. You have extended the series to about 85 years, from the year 1928 to 2012, by
using long term rainfall data, and linear regression equation, developed for the purpose.

Why do you feel the need for extending the series for 85 years, and not restrict it only to about 40 years, which could be considered as adequate, as per the Guidelines?

Ans. In the document, MARK-5, made available to me, the 40 years recommended length of data is with respect to A4 type of projects. For type A3, the recommended length is 25 years. I would also like to refer to the document MARK-1, (Annex 2.4 on page A2.1-11, thereof), rainfall-runoff correlation method has been suggested even for short term data of 5 to 10 years, at para 2. Therefore, although the requirement of a data is associated with the type of the specific project in question, and that is the major emphasis of these manuals, the present study is more in terms of evaluating the yield of the basin, without referring to any specific project. For the purpose, a data length of around 30 years is more than reasonable, for developing reliable R-R equation."
898. In view of above, the series of annual average rainfall values over the Mahadayi basin for 112 years (from 1901-02 to 2012-13) has been analyzed by the Tribunal to examine the presence of trend. The plot of the annual average rainfall of 112 years is shown in Fig. 2 below, which clearly indicates a rising trend. Statistical tests were made by the Tribunal as per the
procedure laid down in "Chapter A3 - Statistical Methods in Water Resources by D.R. Helsel and R.M. Hirsch of Book 4, Hydrologic Analysis and Interpretation" (MARK-32) to ascertain whether the trend is significant or not. The value of ' $\mathbf{t}$ ' was found to be 10.22 which is considerably higher than the value of ' $\mathbf{t c r r i t}$ ', i.e., 2.6. Thus the trend is significant.

Fig.2: Average Annual Rainfall Over Mahadayi Basin from 1901-02 to 2012-13

899. In view of the provisions in the "Guidelines for Preparation of Detailed Project Reports of Irrigation and Multipurpose Projects" of the Government of India, Ministry of Water Resources published in 2010 (MARK-5), a series of 40 years of most recent available data of annual average rainfall over the Mahadayi river basin for the years from 1973-74 to 2012-13 has
been plotted to check the presence of trend, if any, and the same is shown in Fig. 3 herein below. The Fig. 3 also exhibits presence of rising trend, though with very mild slope. Statistical tests were made as per the procedure laid down in "Chapter A3 - Statistical Methods in Water Resources by D.R. Helsel and R.M. Hirsch of Book 4, Hydrologic Analysis and Interpretation" to ascertain whether the trend is significant or not. This document was shown to Shri S. N. Huddar, Expert Witness for the State of Maharashtra and the same has been marked as MARK-32 The value of ' t ' was found to be 2.36 which is less than the value of ' $\mathrm{t}_{\text {crit }}$ ', i.e., 2.6. Thus the trend is insignificant and hence, no correction is needed in the series of 40 years of recent available data of annual average rainfall over Mahadayi river basin as far as 'trend' is concerned.

900. In view of above position, the Tribunal has decided to use the most recent available data of 40 years (from 1973-74 to 2012-13) of the Annual Average Rainfall over the entire Mahadayi river Basin for generation of the runoff series for assessing the water availability. The daily rainfall data of the seven Grid Points and the average thereof, the computed monthly and annual rainfall data are being reproduced after para 923 of this Report.

## Transforming the Annual Rainfall into Annual Runoff - Choice of Model

901. The Tribunal has observed that the model developed and used in different Reports filed by the States of Goa, Karnataka and Maharashtra and that by the Expert Witnesses are simple linear regression equation of the form "Runoff $(R)=A x$ Rainfall $(P)+B "$. Thus all the models are primarily of the same form. However, the values of the parameters ' $A$ ' and ' $B$ ' differ in view of the input values i.e., the values of rainfall and runoff used by the Experts for estimating these parameters.
902. Simple linear regression equations developed and used by the Experts in their respective Reports are summarized as under.
Sl. Report Equation

No.

1. Report of CWC of $2003-R=0.87891 \times P-49.6451$ Para 3.3, page 10, Vol. 15
2. Report of Shri S. N. Huddar
$R=0.8791 \times P-50.106$ of September 2015 - Para 12, page 34, Vol. 163(a)
3. Report of Prof. A. K. Gosain $R=0.7368 \times P+432.28$
of September 2015 - Para
7.4.2, page 43, Vol. 166
4. Report of Shri Chetan $R=0.689 \times P-115.454$

Pandit of August 2016 page 57, Vol. 191
5. Report of Shri Chetan $R=0.692967 \mathrm{x}$ P Pandit of August 2016 - 168.195
Table 33, page 93, Vol. 191
6. Report of Prof. A. K. Gosain $R=0.749 \times P+214.2$ of May 2017 - Para 3.4.1, page 6, Vol. 198
7. Equation developed by the
$R=0.7904 \times P-219.619$
State of Goa using the gridded rainfall data and submitted to the Tribunal during the arguments (Page 12, Vol. 237D)
8. Equation developed by the
$R=0.981 \times P-269.2$
State of Karnataka using the gridded rainfall data and submitted to the Tribunal during the arguments (Page 1, Vol. 238A)
903. As already discussed in the preceding paras, the above mentioned linear regression equations have been derived by using the rainfall and runoff data. The data used by CWC as also
by Prof. Gosain and that by Shri Chetan Pandit are, however, not found reliable due to the reasons explained in earlier paragraphs. Shri S. N. Huddar has used the data of CWC, which is, in itself, not reliable. Therefore, none of the above equations can be considered as reliable and worth adopting for independent analysis and assessment of water availability. The Tribunal has, therefore, no option but to adopt an appropriate empirical formula.
904. A most commonly used empirical formula which is based on the data of Western Ghats is the Inglis and De Douza Formula, most commonly called as Inglis Formula. The Inglis Formula for Ghat area is: $R=0.85 \times P-305$, where values of runoff $(R)$ and precipitation $(P)$ are in $m m$.
905. The Tribunal also notes that Inglis Formula is, in fact, included as one of the Rainfall-Runoff models developed for specific regions in India in the Report titled "Development of Hydrological Design Aids (Surface Water) under Hydrology Project II - State of the Art Report, July 2010" of the Government of India, Ministry of Water Resources, Central Water Commission
[MARK-1]. Relevant Extract from MARK-1 related to Inglis Formula are reproduced as under.

> "Inglis and De Souza's Formula (1946) Inglis and De Souza used data from 53 stream gauging sites in Western India. He studied catchments in western ghats and plains of Maharashtra, India and gave the following relationships. For ghat areas R = 0.85 P - 30.5 .... Where $\quad$ R = runoff (cm) $$
\text { P = precipitation (cm)" }
$$

906. The State of Goa at Para 154B, page 159 of the Statement of Case of the State of Goa (Volume 131) has, adversely commented about the Inglis Formula that the same is "an empirical outdated and unrealistic formula". However, the Tribunal finds that the Inglis Formula is, in fact, a simple linear regression equation of the same form which has been derived and used by all the Expert Witnesses for Mahadayi river basin.
907. Shri Chetan Pandit was asked a specific question relating to estimation of water availability in the event of hydrological and hydro-meteorological data being either inadequate or not at all available. The relevant part of question

No. 153 put to Shri Pandit by the Tribunal on 5.10.2016 and his reply, are reproduced hereunder.
"Q.No.153.
c) How will you proceed with the process of estimation of water availability at a specific point along a river for a basin or sub-basin in India when the available hydrological and hydro-meteorological data are not adequate?
d) Is it possible to estimate the availability of water at a specific point along a river for a basin or sub-basin in India if requisite hydrological and hydro-meteorological data are not at all available? If yes, please tell us about commonly used procedures very briefly.
Ans.
c \& d) If the inadequacy is so high that even the process of filling a few missing data does not serve the purpose, then the entire approach explained above will have to be changed. The extreme case of inadequate data is - no data. Many years ago a British Engineer by name Strange developed a Table, which is known as Strange's table which helps determine the water availability based on only a few parameters like the catchment area, mean annual rainfall etc. Such methods are called empirical methods. For other aspects of hydrologic analysis, viz., flood studies etc., there are other empirical formulae available viz., Inglis Formula, Nawab Sher Bahadur Jung Formula etc. These formulae may be used. But empirical formulae will give only a water availability figure without any attached dependability like $50 \%, 75 \%$ etc.

CWC has also done some studies called "Regional Hydrologic Studies" where hydrology of an entire region is studied and this can be used. In short, compromises will have to be made and it will have to be kept in view that the outcome is less reliable."
908. Further, in his reply to the question No. 172, put to him by the Tribunal on 5.10.2016, Shri Chetan Pandit, inter-alia, has stated as under.

> "... The practice of hydrology continues with rather simple techniques like linear regression for monsoon or annual rainfall and runoff. ..."
909. Similarly Prof. A. K. Gosain, in his reply to question No. 35, put to him by the Tribunal on 14.7.2017 mentioned about the use of Inglis Formula. The question No. 35 and the reply thereof by Prof. Gosain are as under.
> "Q.No.35. At Para 4, page 3 of the additional affidavit dated 15.11.2016 (Volume 193), you have mentioned that "the methods deployed by the respective departments to estimate the water yield have been variable since there is no unique approach that is universally used".

Please name the various departments and the methods deployed by each of them to estimate the water yield.

Ans. I do not have the record of which Department has used which method for estimating water yield, however, I can tell that the methods employed by the various Departments ranged from empirical relationships, such as Inglis Formula, and Rational method to approaches such as Area Proportion method."
910. The Tribunal also notices that the State of Goa has used the Inglis Formula for estimation of runoff from rainfall data in the detailed project reports (DPR) of at least 49 proposed projects in Mahadayi basin, namely, (i) Sonal - I [Volume 103(b)], (ii) Sonal [Volume 103(a)], (iii) Shelpi [Volume 103(d)], (iv) Bimbal - I [Volume 103(f)], (v) Ganjem [Volume 103(h)], (vi) Usgao [Volume 103(i)], (vii) Mandovi Nanoda [Volume 103(j)], (viii) Iverkhurd [Volume 103(k)], (ix) Golali [Volume 103(m)], (x) Thane [Volume 103(n)], (xi) Dongurwada [Volume 103(o)], (xii) Thane - I [Volume 103(p)], (xiii) Naneli - I [Volume 103(q)], (xiv) Pale [Volume 103(r)], (xv) Naneli - II [Volume 103(s)], (xvi) Zarme [Volume 103(t)], (xvii) Ragada - I [Volume 103(u)], (xviii) Ragada II [Volume 103(v)], (xix) Nandran [Volume 103(w)], (xx) Avardo [Volume 103(x)], (xxi) Nandran - I [Volume 103(y)], (xxii) Jamboli [Volume 103(z)], (xxiii) Satpal [Volume 103(ab)], (xxiv) Fatiyagal
[Volume 103(ac)], (xxv) Ragada - III [Volume 103(ad)], (xxvi) Udalshem [Volume 103(ae)], (xxvii) Kumbharwada [Volume 103(af)], (xxviii) Shivde [Volume 103(ag)], (xxix) Paikul [Volume 103(ah)], (xxx) Melavali [Volume 103(ai)], (xxxi) Sonawali - I [Volume 103(aj)], (xxxii) Sonawali - II [Volume 103(ak)], (xxxiii) Mayda [Volume 103(al)], (xxxiv) Karanzol [Volume 103(am)], (xxxv) Khandepar [Volume 103(an)], (xxxvi) Ghatakwada [Volume 103(ao)], (xxxvii) Nayawada [Volume 103(ap)], (xxxviii) Dongurli [Volume 103(aq)], (xxxix) Kharamol [Volume 103(ar)], (xl) Kharamol - II [Volume 103(as)], (xli) Matujanwada [Volume 103(at)], (xlii) Kajumol [Volume 103(au)], (xliii) Suktoli [Volume 103(av)], (xliv) Tatodi [Volume 103(aw)], (xlv) Nirankal [Volume 103(ax)], (xlvi) Ponsule [Volume 103(ay)], (xlvii) Kodar [Volume 103(az)], (xlviii) Keri [Volume 103(aa)], and (xlix) Advalpal [Volume 103(bb)].
911. In view of above, the Tribunal decides to use Inglis Formula as a reasonable approach, particularly in view of the fact that the rainfall and the runoff data sets used by the State of Goa and that by the State of Karnataka cannot be relied upon.

## Generation of Annual Runoff Series and Estimation of Water Availability for the Entire Basin

912. Using the Annual Average Rainfall of 40 years (i.e., from 1973-74 to 2012-13) as given in the Table-3, and adopting the Inglis Formula, annual runoff series of 40 years is generated for the Mahadayi river basin by the Tribunal and the same is shown in Table-4.

Table-4: Computation of Annual Runoff for Mahadayi River Basin

| Year | Average Annual Rainfall (in mm) for Entire Mahadayi Basin (2032 sq.km.) | Annual Runoff (in mm) for Entire Mahadayi Basin (2032 sq.km.) [(Rainfall in Col.2)*0.85 305] | Annual Runoff Series for Entire Mahadayi Basin [of Col.3] in Descending Order | Rank No. | Dependability |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 2 | 3 | 4 | 5 | 6 |
| 1973-74 | 2922.6 | 2179.2 | 4746.3 | 1.0 | 2.4 |
| 1974-75 | 2844.1 | 2112.5 | 4295.2 | 2.0 | 4.9 |
| 1975-76 | 3585.1 | 2742.3 | 3922.0 | 3.0 | 7.3 |
| 1976-77 | 2170.6 | 1540.0 | 3806.6 | 4.0 | 9.8 |
| 1977-78 | 3097.9 | 2328.2 | 3618.5 | 5.0 | 12.2 |
| 1978-79 | 3904.5 | 3013.8 | 3606.8 | 6.0 | 14.6 |
| 1979-80 | 3443.1 | 2621.7 | 3593.3 | 7.0 | 17.1 |
| 1980-81 | 4615.9 | 3618.5 | 3582.0 | 8.0 | 19.5 |
| 1981-82 | 4573.0 | 3582.0 | 3536.4 | 9.0 | 22.0 |
| 1982-83 | 4503.0 | 3522.6 | 3528.6 | 10.0 | 24.4 |
| 1983-84 | 4224.1 | 3285.5 | 3522.6 | 11.0 | 26.8 |
| 1984-85 | 3703.2 | 2842.7 | 3325.2 | 12.0 | 29.3 |
| 1985-86 | 3443.9 | 2622.3 | 3285.5 | 13.0 | 31.7 |
| 1986-87 | 3124.5 | 2350.9 | 3284.7 | 14.0 | 34.1 |
| 1987-88 | 3152.2 | 2374.4 | 3252.9 | 15.0 | 36.6 |
| 1988-89 | 4510.1 | 3528.6 | 3223.1 | 16.0 | 39.0 |
| 1989-90 | 3802.5 | 2927.1 | 3219.0 | 17.0 | 41.5 |
| 1990-91 | 4602.1 | 3606.8 | 3092.8 | 18.0 | 43.9 |
| 1991-92 | 3997.4 | 3092.8 | 3083.8 | 19.0 | 46.3 |
| 1992-93 | 4150.7 | 3223.1 | 3013.8 | 20.0 | 48.8 |
| 1993-94 | 4223.1 | 3284.7 | 2984.8 | 21.0 | 51.2 |
| 1994-95 | 5942.7 | 4746.3 | 2927.1 | 22.0 | 53.7 |
| 1995-96 | 3417.7 | 2600.0 | 2912.8 | 23.0 | 56.1 |
| 1996-97 | 3744.8 | 2878.1 | 2891.3 | 24.0 | 58.5 |

| $1997-98$ | 4973.0 | 3922.0 | 2878.1 | 25.0 | 61.0 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $1998-99$ | 3986.8 | 3083.8 | 2842.7 | 26.0 | 63.4 |
| $1999-00$ | 4519.2 | 3536.4 | 2840.7 | 27.0 | 65.9 |
| $2000-01$ | 3870.4 | 2984.8 | 2742.3 | 28.0 | 68.3 |
| $2001-02$ | 3158.0 | 2379.3 | 2722.3 | 29.0 | 70.7 |
| $2002-03$ | 3192.8 | 2408.9 | 2622.3 | 30.0 | 73.2 |
| $2003-04$ | 3785.7 | 2912.8 | 2621.7 | 31.0 | 75.6 |
| $2004-05$ | 3760.3 | 2891.3 | 2600.0 | 32.0 | 78.0 |
| $2005-06$ | 4270.9 | 3325.2 | 2408.9 | 33.0 | 80.5 |
| $2006-07$ | 5412.0 | 4295.2 | 2379.3 | 34.0 | 82.9 |
| $2007-08$ | 4837.2 | 3806.6 | 2374.4 | 35.0 | 85.4 |
| $2008-09$ | 4185.8 | 3252.9 | 2350.9 | 36.0 | 87.8 |
| $2009-10$ | 4145.8 | 3219.0 | 2328.2 | 37.0 | 90.2 |
| $2010-11$ | 3561.6 | 2722.3 | 2179.2 | 38.0 | 92.7 |
| $2011-12$ | 4586.2 | 3593.3 | 2112.5 | 39.0 | 95.1 |
| $2012-13$ | 3700.8 | 2840.7 | 1540.0 | 40.0 | 97.6 |

913. The Table-4 also indicates the dependability assigned to each of the values of annual runoff for 40 years by putting the same in descending order. From this Table, (i) the average annual water availability of Mahadayi river basin and (ii) the water availability at 75\% dependability, are estimated by the Tribunal as under.

| Description | Water availability <br> (in mm / Mcum / <br> tmc) |
| :--- | :--- | :--- |
| Average annual water availability of <br> Mahadayi river basin (for entire <br> catchment area of 2032 sq.km.) | 3045.0 mm <br> i.e., 6187.4 Mcum <br> i.e., 218.41 tmc |

| Water availability of Mahadayi river basin | 2621.8 mm |
| :--- | :--- |
| (for entire catchment area of 2032 | i.e., 5327.5 Mcum |
| sq.km.) at 75\% dependability | i.e., 188.06 tmc |

Assessment of Water Availability (a) For the Catchment Area of Mahadayi river basin in the State of Karnataka, (b) For the Catchment Area of Mahadayi river basin in the State of Maharashtra, and (c) For various project Sites in the States of Karnataka and Maharashtra
914. As in the case of entire Mahadayi river basin, the water availability has also been assessed for (a) the catchment area of Mahadayi river and its tributaries in the State of Karnataka, (b) the catchment area of tributaries of Mahadayi river basin in the State of Maharashtra, and (c) the catchment areas of the proposed project Sites in the States of Karnataka and Maharashtra by using the same approach viz., (i) using the rainfall values of recent 40 years (from 1973-74 to 2012-13) estimated by IMD at the concerned Grid Points, and (ii) applying Inglis Formula for generation of runoff series. For the proposed project sites in the territory of Karnataka and Maharashtra, water availability at $90 \%$ dependability has also been computed in addition to the
average annual water availability and water availability at 75\% dependability.
915. The specific Grid Point (s), whose rainfall values are used by the Tribunal for the aforesaid purpose, are as under.

| SI. <br> No. | Details of Catchment Area | Corresponding Grid Point (s) |
| :---: | :---: | :---: |
| 1. | Catchment area of Mahadayi river and its tributaries in the State of Karnataka (for catchment area of 375 sq.km.) | Grid Points $74^{\circ} 15^{\prime} \mathrm{E}$ $15^{\circ} 15^{\prime} \mathrm{N}, 74^{\circ} 15^{\prime} \mathrm{E}$ <br> $15^{\circ} 30^{\prime} \mathrm{N}$ and $74^{\circ} \mathrm{E}$ $15^{\circ} 45^{\prime} \mathrm{N}$ |
| 2. | Catchment area of tributaries of Mahadayi river in the State of Maharashtra (for catchment area of 77 sq.km.) | $\begin{aligned} & \text { Grid Point } 74^{\circ} \mathrm{E} \\ & 15^{\circ} 30^{\prime} \mathrm{N} \text { and } 74^{\circ} \mathrm{E} \\ & 15^{\circ} 45^{\prime} \mathrm{N} \end{aligned}$ |
| 3. | Kalasa dam (including Haltara and Surla diversion) with catchment area of $25.50 \mathrm{sq} . \mathrm{km}$. | Grid Point $74^{\circ} 15^{\prime} \mathrm{E}$ $15^{\circ} 30^{\prime} \mathrm{N}$ |
| 4. | Bhandura dam with catchment area of 32.25 sq.km. | $\begin{aligned} & \text { Grid Point } 74^{\circ} 15^{\prime} \mathrm{E} \\ & 15^{\circ} 30^{\prime} \mathrm{N} \end{aligned}$ |
| 5. | Kotni dam (including Bhandura dam catchment and diversion of Irti, Bailnadi) with catchment area of 125.44 sq.km. | $\begin{aligned} & \text { Grid Point } 74^{\circ} 15^{\prime} \mathrm{E} \\ & 15^{\circ} 30^{\prime} \mathrm{N} \end{aligned}$ |
| 6. | Kotni dam site (independent | Grid Point 74* ${ }^{\circ} 5^{\prime} \mathrm{E}$ |

|  | catchment) with catchment area of <br> 93.19 sq.km. | $15^{\circ} 30^{\prime} \mathrm{N}$ |
| :--- | :--- | :--- |
| 7. | Bailnadi with catchment area of <br> 32.33 sq.km. | Grid Point $74^{\circ} 15^{\prime} \mathrm{E}$ <br> $15^{\circ} 30^{\prime} \mathrm{N}$ |
| 8. | Irti dam site with catchment area of <br> 8.78 sq.km. | Grid Point $74^{\circ} 15^{\prime} \mathrm{E}$ <br> $15^{\circ} 30^{\prime} \mathrm{N}$ |
| 9. | Irti Pick-up dam (independent <br> catchment) with catchment area of <br> 9.91 sq.km. | Grid Point $74^{\circ} 15^{\prime} \mathrm{E}$ <br> $15^{\circ} 30^{\prime} \mathrm{N}$ |
| 10. | Katla-Palna diversion with <br> catchment area of 22.50 sq.km. | Grid Point $74^{\circ} 15^{\prime} \mathrm{E}$ <br> $15^{\circ} 15^{\prime} \mathrm{N}$ |
| 11. | Diggi diversion with catchment area <br> of 15.60 sq.km. | Grid Point $74^{\circ} 15^{\prime} \mathrm{E}$ <br> $15^{\circ} 15^{\prime} \mathrm{N}$ |
| 12. | Viranjole diversion with catchment <br> area of 9.50 sq.km. | Grid Point $74^{\circ} 15^{\prime} \mathrm{E}$ <br> $15^{\circ} 30^{\prime} \mathrm{N}$ |
| 13. | Virdi Large Minor Irrigation Project <br> of Maharashtra with catchment <br> area of 8.25 sq.km. | Grid Point $74^{\circ} \mathrm{E}$ <br> $15^{\circ} 45^{\prime} \mathrm{N}$ |

916. The rainfall values related to (a) the catchment area of Mahadayi river and its tributaries in the State of Karnataka, and (b) the catchment area of tributaries of Mahadayi river basin in the State of Maharashtra have accordingly been computed and the same are shown in Table-5. The Table-5 also indicates the corresponding values of the runoff computed by using Inglis

# Formula and the percentile dependability value associated with 

## each value of the runoff.

Table-5: Annual Runoff from Catchment Areas of Mahadayi River Basin in Territory of Karnataka and Maharashtra

| Year | Average rainfall over basin area in Karnataka <br> Weighted av. of rain at GP $74^{\circ} 15^{\prime} \mathrm{E}$ $15^{\circ} 15^{\prime} \mathrm{N}$, $74^{\circ} 15^{\prime} \mathrm{E}$ $15^{\circ} 30^{\prime} \mathrm{N}$ \& $74^{\circ} \mathrm{E}$ $15^{\circ} 45^{\prime} \mathrm{N}$ | Average rainfall over basin area in Maharashtra <br> - Weighted av. of rain at $\begin{gathered} \mathrm{GP} 74^{\circ} \mathrm{E} \\ 15^{\circ} 30^{\prime} \mathrm{N} \& \\ 74^{\circ} \mathrm{E} 15^{\circ} 45^{\prime} \mathrm{N} \end{gathered}$ | Annual Runoff for basin area in Karnataka [(Col.2)*0.85 $-305]$ | Annual Runoff for Basin Area in Maharashtra $\begin{gathered} {[(\text { Col.3)*0.85 }} \\ -305] \end{gathered}$ | Annual Runoff Series of Karnataka Area (Col. 4) in Descending Order | Annual Runoff Series of Maharashtra Area (Col. 5) in Descending Order | Rank <br> No. | Depend -ability |

| 8. | Proposed Katla- <br> Palna diversion <br> scheme with <br> catchment area of <br> 22.50 sq.km.  | 2838.6 mm <br> i.e., 63.9 Mcum i.e., 2.25 tmc | 2431.7 mm i.e., 54.7 Mcum i.e., 1.93 tmc | 2053.3 mm <br> i.e., 46.2 Mcum i.e., 1.63 tmc |

| 9. | ProposedDiggi <br> diversion scheme <br> with catchment area <br> of 15.60 sq.km.2838.6 mm <br> i.e., 44.3 Mcum <br> i.e., 1.56 tmc | 2431.7 mm <br> i.e., 37.9 Mcum <br> i.e., 1.34 tmc | 2053.3 mm <br> i.e., 32.0 Mcum <br> i.e., 1.13 tmc |  |
| :--- | :--- | :--- | :--- | :--- |
| 10. | Proposed Viranjole <br> diversion scheme <br> with catchment area <br> of 9.50 sq.km. | 2965.8 mm <br> i.e., 28.2 Mcum <br> i.e., 0.99 tmc | 2439.9 mm <br> i.e., 23.2 Mcum <br> i.e., 0.82 tmc | 1724.2 mm <br> i.e., 16.4 Mcum <br> i.e., 0.58 tmc |
| Proposed Project in Maharashtra |  |  |  |  |
| 11. | Virdi Large Minor <br> Irrigation Project of <br> Maharashtra on <br> Kattica Nalla with <br> total catchment area <br> of 8.25 sq.km. | 3324.1 mm <br> i.e., 27.4 Mcum <br> i.e., 0.97 tmc | 2590.6 mm <br> i.e., 21.37 Mcum <br> i.e., 0.75 tmc | 1545.8 mm <br> i.e., 12.75 Mcum <br> i.e., 0.45 tmc |

920. It may be noted that the average annual runoff of 3034 mm based on the observed data by the State of Karnataka at Chapoli gauging site reasonably matches with the assessed runoff of 2966 mm found by the Tribunal for the catchment area of Mahadayi river and its tributaries in the State of Karnataka (for catchment area of 375 sq.km.). Similarly the runoff of 3324.1 mm assessed by the Tribunal for the catchment area of tributaries of Mahadayi river in the State of Maharashtra (for catchment area of 77 sq.km.) matches reasonably with the average annual runoff of 3252 mm estimated on the basis of observed data at the Virdi gauging site of the State of Maharashtra.
921. The results of independent study have also been compared in respect of the runoff factor, with the runoff factor indicated in Table 33, page 93 of the "Affidavit of Examination-inChief of Shri Chetan Pandit" (Volume 191) in respect of the observed runoff data at Ganjim for the years 2001 to 2005, which is considered as correct one, by Shri Pandit and used for his analysis. The runoff factors indicated in Table 33, page 93, Volume 191 by Shri Pandit for the years 2001, 2002, 2003, 2004 and 2005 are $0.7379,0.6837,0.7438,0.8868$ and 0.7770 respectively. The average of these five values of runoff factors has been computed by the Tribunal as 0.7658 . The average runoff factor in respect of the 40 years of runoff series (for the period from 1973-74 to 2012-13) has also been assessed by the Tribunal using the average annual rainfall value of 3941.1 mm and the average annual runoff value of 3045.0 mm as mentioned in the Table-4. The runoff factor works out to be 0.77 (=3045.0/3941.1), which is quite comparable with the average of the runoff factors of the aforesaid five years adopted by Shri Pandit.
922. A comparison of the water availability as reported by the party States and as assessed by the Tribunal has been made and summarized hereunder.
I. Water availability for entire Mahadayi basin (catchment area of 2032 sq.km.) at 75\% dependability
a. As per report filed by the State $=198.42$ to 206.17 tmc of Karnataka
b. As per report filed by the State $=151.47$ to 154.4 tmc of Goa
c. As per report filed by the State $=208.73 \mathrm{tmc}$ of Maharashtra
d. As assessed by the TRIBUNAL $=188.06 \mathrm{tmc}$
II. Water availability for catchment area of 375 sq.km. of Mahadayi basin in Karnataka at 75\% dependability
a. As per report filed by the State of Karnataka $=44.15 \mathrm{tmc}$
b. As assessed by the TRIBUNAL $=32.11 \mathrm{tmc}$
III. Water availability for catchment area of 77 sq.km. of Mahadayi basin in Maharashtra at 75\% dependability
a. As per report filed by the State of $=6.25$ to 7.48 tmc Maharashtra
b. As assessed by the TRIBUNAL $=7.21 \mathrm{tmc}$
IV. Water availability at $75 \%$ dependability (in tmc) in respect of various proposed project sites on Mahadayi or its tributaries in Karnataka

| SI. <br> No. | Project site | As <br> assessed <br> by <br> Karnataka | As <br> assessed <br> by Goa | As <br> assessed <br> by the <br> TRIBUNAL |
| :--- | :--- | :---: | :---: | :---: |
| 1. | Proposed Kalasa dam <br> site (including Haltara <br> and Surla diversion) <br> with catchment area <br> of 25.50 sq.km. | 3.8 tmc | 1.98 tmc | 2.19 tmc |
| 2. | Proposed Bhandura <br> dam site with <br> datchment area of <br> 32.25 sq.km. | 3.7 tmc | 1.50 tmc | 2.77 tmc |
| 3. | Proposed Kotni dam <br> site (independent <br> catchment) with <br> catchment area of <br> 93.19 sq.km. | 10.6 tmc | 6.59 tmc | 8.02 tmc |

| 4. | Proposed Kotni dam <br> site (including  <br> Bhandura  dam <br> catchment  and <br> diversion of Irti, <br> Bailnadi) with  <br> latchment area of <br> 125.44 sq.km.   | 19.4 tmc | - | 10.80 tmc |
| :---: | :---: | :---: | :---: | :---: |
| 5. | Proposed Bailnadi diversion site with catchment area of 32.33 sq.km. | 3.7 tmc | 1.77 tmc | 2.78 tmc |
| 6. | Proposed Irti dam site with catchment area of 8.78 sq.km. | 0.9 tmc | 0.4 tmc | 0.76 tmc |
| 7. | Proposed Irti Pick-up dam site (independent catchment) with catchment area of 9.91 sq.km. | 1.2 tmc | 0.81 tmc | 0.85 tmc |
| 8. | Proposed Katla-Palna diversion scheme with catchment area of $22.50 \mathrm{sq} . \mathrm{km}$. | 2.5 tmc | 1.52 tmc | 1.93 tmc |
| 9. | Proposed Diggi diversion scheme with catchment area of 15.60 sq.km. | 1.8 tmc | 1.05 tmc | 1.34 tmc |

| 10. | Proposed Viranjole <br> diversion scheme <br> with catchment area <br> of 9.50 sq.km. | 0.8 tmc | 0.73 tmc | 0.82 tmc |
| :--- | :--- | :--- | :--- | :--- |

V. Water availability in respect of proposed project site on Kattica Nalla, a tributary of Mahadayi in Maharashtra
a. As per report filed by the State of Maharashtra $=0.80 \mathrm{tmc}$
b. As assessed by the Tribunal
$=0.75 \mathrm{tmc}$
923. In view of the above, the water availability assessed by the Tribunal and indicated in the aforesaid Para 913, Para 918, and Para 919 are adopted by the Tribunal for further examination of the claims of the three party States.
