Abstract

Mathematics research in India, as reflected by papers indexed in *Mathsci* 1990 and 1994, is quantified and mapped. There were 1319 papers originating in India and indexed in the 1990 disc of *Mathsci* CD-ROM version, and 1391 papers indexed in 1994. Of these 2710 papers, 2549 had appeared in 467 journals, 221 of which were indexed in *Journal Citation Reports* 1994. Indian researchers had published 999 papers in these two years in 62 Indian journals, 503 papers in 108 US journals, 254 papers in 40 journals from the Netherlands, and 155 papers in 42 British journals. 188 institutions located in 110 cities/towns and 23 states/union territories had contributed to India's research output indexed in *Mathsci*, although only three have contributed more than a hundred papers in the two years, and another nine had contributed 50 or more papers. Academic institutions had published 87% of all papers and central government funded research councils and departments accounted for 12.6%. Four cities, viz. Calcutta, New Delhi, Bombay, and Madras had published more than 200 papers each in the two years. Five states, viz. West Bengal, Uttar Pradesh, Maharashtra, Tamil Nadu, and Delhi had published more than 250 papers each. More than 53% of journal papers were published in journals not indexed in *Journal Citation Reports*. Only 81 papers had appeared in journals of impact factor greater than 2.000, and these are mostly physics journals. Of the 61 subfields in *Mathsci*, Indian researchers had been most active in Statistics, General topology, Quantum theory, and Special functions. India has a high activity index for Special functions and General topology and a moderately high activity index for Statistics, Integral transforms and Operational calculus, and Sequences, series and summability. The activity is low in Partial differential equations, Ordinary differential equations, Numerical analysis, K-theory, and Computer science. The future of mathematics in India seems to rest with DAE, TIFR and ISI. Universities seem to be losing momentum.

Status of mathematics research in India in 1990 and 1994: An analysis based on *Mathsci*

Introduction

Mathematics is the basis of modern civilization, although much of the pursuit of mathematics is without any inkling to the real world, says Basil Gordon of the University of California at Los Angeles. Indeed there is something for everybody to gain from the universal language of mathematics. Today it is virtually impossible to do advanced level work in any branch of science or engineering or some areas of economics and social sciences without the application of mathematics.

India has a very long tradition of excellence in mathematics and astronomy, dating back to antiquity. In modern times India has produced much work in both pure and applied mathematics as well as in the related areas of operations research, statistics, computer science and theoretical physics. According to Basil Gordon, Russia and the USA are the top contributors to the literature of mathematics, followed by England, France, Germany and then India and China. The 20th century has transformed mathematics from a cottage industry run by a few semi-amateurs into a worldwide industry run by an army of professionals, says Michael Atiyah in his preface to *Mathematics: Frontiers and Perspectives*, brought out by the American Mathematical Society on behalf of the International Mathematical Union as part of the celebration of the Year of Mathematics. A part of the army lives and works in India. Today Indian mathematicians, statisticians and computer scientists are welcome everywhere. Virtually every major university in North America has one or more Indian mathematicians, statisticians or computer scientists on its faculty.

There are a few accounts of mathematics research in 20th century India. Notable among them are those by Varadarajan¹, Narasimhan² and Seshadri,³ all outstanding

mathematicians. They have written from the perspective of professional researchers trying to look at achievements of Indian mathematics, both of individuals and of institutions. In contrast, this report is written from the perspective of scientometricists trying to map mathematics research in India by analysing the published literature. There is another difference: While the three eminent mathematicians have covered several decades, we have analysed the research output over two selected years, 1990 and 1994.

The words "Indian mathematics" evoke in the minds of most people the images of Ramanujan and the well-known mathematicians of ancient India such as Aryabhata, Bhaskara and Brahmagupta. But what about more recent times? Narasimhan² has chronicled the work of Indian mathematicians in the first half of the Twentieth Century, who under very difficult circumstances kept mathematical traditions alive in India. He singles out Calcutta and Madras as the two most important centres and has paid handsome tributes to K Anand Rau, R Vaidyanathaswamy, T Vijayaraghavan, S S Pillai and S Minakshisundaram of the Madras school, Syamdas Mukhopadhyay, Nikhilranjan Sen, Rabindranath Sen, P C Mahalanobis [founder of Indian Statistical Institute (ISI), Calcutta], and R C Bose of the Calcutta school, and Komaravolu Chandrasekharan [who founded the school of mathematics at Tata Institute of Fundamental Research (TIFR), Bombay] and C T Rajagopal (Ramanujan Institute, Madras). Narasimhan² pays glowing tributes to C P Ramanujam, "certainly one of the most powerful mathematical minds to emerge in India since the mid-fifties" and "in many ways, a singular figure."

Varadarajan¹ and Seshadri³ have written brief accounts of mathematics in post-independent India. Both of them highlight the very important role played by TIFR, largely thanks to the initial leadership of K Chandrasekharan, and ISI, Calcutta, where C Radhakrishna Rao played a crucial role. Among those who made a mark in this period are C P Ramanujam and V K Patodi, both of whom died in the prime of their creative life, C S Seshadri, M S Narasimhan, M S Raghunathan, S Ramanan, K Ramachandra (all of TIFR), C R Rao, S R S Varadhan, V S Varadarajan (all three now in the USA), K R Parthasarathy, and R Ranga Rao (all of ISI, Calcutta). Mention must also be made of certain foreigners such as the Jesuit priest Fr Racine of France and F W Levi of Germany, both of whom had worked in India and helped many young aspiring Indian mathematicians.

In what follows, we have attempted to map India's contribution to the literature of mathematics and related fields as seen from two years (1990 and 1994) of *Mathsci* database on CD-ROM. We have identified the institutions active in publishing, the journals used and their impact factors, the subfields in which different institutions are active, etc. We have not extended the analysis to the contributions made by individuals. This study is in continuation of a series of studies on mapping India's contribution to different fields such as physics⁴, biology⁵, agriculture,⁶ medicine,^{7,8} materials science,⁹ and science as a whole (based on data from *Science Citation Index*).¹⁰ Our previous study on mathematics research in India was submitted as a report to NSTMIS-DST, New Delhi.¹¹

Methodology

The techniques used for data collection and analysis are largely similar to our earlier studies.⁴⁻⁹ Bibliographic data on documents originating from Indian institutions were downloaded from the *Mathsci* CD-ROM database, giving "(6-*)" as the search command under 'IN' (for institution) for the disc years 1990 and 1994. This search picks up all entries having an Indian address in the byline irrespective of whether it is the address of the first author, second author or the last author. Unlike with some other bibliographic databases on CD-ROM, downloading such data from *Mathsci* database is simple and straightforward. The fields downloaded are: AU (author), PY (publication year), JN (journal title), LA (language), PC (subject descriptor), DT (document type), and IN (institution name).

The *Mathsci* database has 61 sections covering such diverse subfields as "History and biography", "information and communication, circuits", and "Functions of a complex variable." While most subfields are part of mainstream mathematics, some subfields are closely related to mathematics, such as "Statistics", "Computer science", "Astronomy and astrophysics", "Geophysics", "Quantum theory", and "Economics, operations research, programming, games".

Impact factor values for journals were noted from *Journal Citation Reports* 1994. Not all journals indexed in *Mathsci* are indexed in *Science Citation Index*, and those journals not indexed in *SCI* are not assigned an impact factor.

The data were analysed using programs generated inhouse using FoxPro, Excel and Access.

Findings

Mathsci has indexed 1319 publications from India in 1990 and 1391 in 1994. But for 14 of these papers written in Hindi, all the rest were in English (Table 1). In Table 2, we have classified the documents by document type, as given in the database. Journal papers account for 93.4% of all publications in 1990 and 94.5% in 1994. The publication years of papers indexed in the two disc years are given in Table 3. For some reason, the database lists more than one publication year in some entries.

Journals often used

Indian researchers have used 467 journals in these two years to publish 2,549 papers in the area of mathematics and related fields (Table 4) for an average of 5.5 papers per journal in two years. Apart from the title of the journal, we have listed in this table, the country of publication of the journal and the impact factors of the journals as seen from *Journal Citation Reports*. As not all journals are listed in JCR, we have shown zero impact factor for all non-JCR journals. The three journals that have published the largest number of papers from India are Indian journals. The next two are American journals, one of them a statistics journal. Thirteen of the twenty journals often used by Indian mathematicians to publish their work are Indian journals. India has published more than ten papers in the two years in 66 journals and more than 20 papers in 27 journals. At the other extreme, India has published just one paper in 174 journals and two papers each in 76 journals. Figure 1 is a plot of number of journals vs. cumulative number of articles. Table 4A lists the same journals as in Table 4, but in the order of descending journal impact factor. Only 221 journals have an impact factor; all the 246 others are not indexed in *SCI* and *JCR*.

Distribution by subfield

Table 5 gives the distribution of the papers by subfield. In all, there are 61 subfields, but Indians are really active only in about half of them. The fields in which

Indian researchers have published large number of papers are: Statistics (code 62), General topology (54), Quantum theory (81), Special functions (33), Economics and operations research (90), and Relativity and gravitation (83). We have calculated the activity index (AI) for each subfield for both 1990 and 1994 using the formula¹²:

$$AI = \frac{\text{the world share of the given country in publication in the given field}}{\text{The overall world share of the given country in publications}}$$

or

$$AI = \frac{\text{the share of the given field in the publication of the given country}}{\text{the share of the given field in the world total of publications}}$$

We have also calculated the relative specialization index (RSI) (Table 6), using the formula

$$RSI = (AI - 1) / (AI + 1).$$

Both Special functions and Integral transforms have recorded a reasonably high activity index in 1990 and a lower value in 1994. In contrast, in General topology, India has recorded a reasonably high activity index in both 1990 and 1994 (Table 5). There are fields like Statistics and Associative rings, where the activity index has remained at a moderate level and within a small range in both 1990 and 1994. In the case of Sequences, series and summability, the activity index has risen sharply from 1.57 in 1990 to 3.18 in 1994. In many subfields the activity is less than 1.0, meaning that the activity in those fields are below the country's overall average. Table 6 lists the relative specialization indices for the different subfields in 1990 and 1994. It should be remembered that no country (or organization) can have positive RSIs for all subfields.

Distribution by journal country

The distribution of papers by country of publication of journal is shown in Table 7. Apart from Indian journals, Indian researchers publish their work often in US journals

and to a lesser extent in journals published from the Netherlands, UK and Germany. In all, in these two years, Indian work has appeared in journals published from more than 40 countries. The 62 Indian journals in which Indian mathematics papers have appeared are listed in Table 8. About 42.5% of journal papers in 1990 and 36.1% of journal papers in 1994 were published in Indian journals. This figure has come down to about 20% in 1998.¹³ Of the 2,549 journal papers, 1369 (nearly 54%) have been published in journals not listed in *JCR*, and 753 (less than 30%) in journals whose impact factor is less than 0.5 (Table 9). Only 62 papers have appeared in journals with an impact factor greater than 3.0, and only 29 in journals with impact factor greater than 3.5. It may be noted that many of these higher impact journals are in the area of physics. Most mathematics journals have a low impact factor.

Distribution by institution

Table 10 lists the 188 Indian institutions that have published papers which have been indexed in *Mathsci* in 1990 and/or 1994. Figure 2 is a plot of number of institutions vs. cumulative number of papers. Well-known mathematics research centers such as the Tata Institute of Fundamental Research, University of Calcutta, Indian Statistical Institute, top the list. Please note that we have not clubbed different centers of Indian Statistical Institute into one entry in this table. While TIFR and University of Calcutta have published fewer papers in 1994 than in 1990, ISI and Indian Institute of Science, Bangalore, have published a larger number of papers in 1994 than in 1990. Table 11 provides a breakup of papers by institutional type. Academic institutions perform the bulk of mathematics research in India. This despite the fact that we have assigned ISI to the Ministry of Planning.

Distribution by city and state

Table 12 lists the number of publications that have come out of different cities and towns and Table 13 the number of publications from different states / union territories. Papers have come from 110 cities/ towns. Calcutta, New Delhi, Mumbai (Bombay), Chennai (Madras), Bangalore, Varanasi and Aligarh lead the rest of India as do West Bengal, Uttar Pradesh, Maharashtra, Tamil Nadu and Delhi among states.

Distribution by institution type

Table 14 lists the institutions under different organizational types. The Department of Atomic Energy's support of mathematics research is evident. However, academic institutions publish the largest number of papers. Figure 3 shows the distribution of papers by institutional type. Academic institutions account for the bulk of India's research output in mathematics and related areas.

Institutional strengths and journals preferred

Table 15 and 16 are in the form of a matrix giving information on the number of papers published by selected institutions in different journals in the two years.

Tables 17 and 18 list papers from selected institutions under journals in different impact factor ranges in the two years. Tata Institute of Fundamental research and Indian Institute of Science have a few papers in the higher impact factor ranges.

Tables 19 and 20 classify papers from selected institutions into different subfields. The large number of zeros indicates that many institutions do not publish work in all subfields. One also notices that institutional strengths have remained the same in both years. For example, Marathwada University has published many papers in Real functions and Hari Singh Gaur University in General topology.

Conclusion

This is a macroscopic study and we have analysed up to the institutional level and not gone to the departmental or individual level. There had been a slight increase in the number of publications in 1994, but as another study by us had shown there had been a considerable decline in 1998. Calcutta, New Delhi, Bombay, Madras, and Bangalore are the major centers of research. TIFR, ISI, and University of Calcutta are the leading institutions. Universities seem to be doing less and less, and publishing in low impact journals.¹⁴ That is not a good sign. Statistics, General topology and Quantum theory are the subfields in which Indian researchers publish large number of papers.
