OBJECTIVE

To construct a square-root spiral.

MATERIAL REQUIRED

Coloured threads, adhesive, drawing pins, nails, geometry box, sketch pens, marker, a piece of plywood.

METHOD OF CONSTRUCTION

- 1. Take a piece of plywood with dimensions $30 \text{ cm} \times 30 \text{ cm}$.
- 2. Taking 2 cm = 1 unit, draw a line segment AB of length one unit.
- 3. Construct a perpendicular BX at the line segment AB using set squares (or compasses).
- 4. From BX, cut off BC = 1 unit. Join AC.
- 5. Using blue coloured thread (of length equal to AC) and adhesive, fix the thread along AC.
- 6. With AC as base and using set squares (or compasses), draw CY perpendicular to AC.
- 7. From CY, cut-off CD = 1 unit and join AD.

Fig. 1

- 8. Fix orange coloured thread (of length equal to AD) along AD with adhesive.
- 9. With AD as base and using set squares (or compasses), draw DZ perpendicular to AD.
- 10. From DZ, cut off DE = 1 unit and join AE.
- 11. Fix green coloured thread (of length equal to AE) along AE with adhesive [see Fig. 1].

Repeat the above process for a sufficient number of times. This is called "a square root spiral".

DEMONSTRATION

1. From the figure, $AC^2 = AB^2 + BC^2 = 12 + 12 = 2$ or $AC = \sqrt{2}$.

 $AD^2 = AC^2 + CD^2 = 2 + 1 = 3 \text{ or } AD = \sqrt{3}$.

2. Similarly, we get the other lengths AE, AF, AG, ... as $\sqrt{4}$ or 2, $\sqrt{5}$, $\sqrt{6}$

OBSERVATION

On actual measurement

$$AC =, AD =, AE =, AF =, AG =
 $\sqrt{2} = AC =(approx.),$
 $\sqrt{3} = AD =(approx.),$
 $\sqrt{4} = AE =(approx.),$
 $\sqrt{5} = AF =(approx.)$$$

APPLICATION

Through this activity, existence of irrational numbers can be illustrated.

OBJECTIVE

To verify the algebraic identity :

 $(a+b)^2 = a^2 + 2ab + b^2$

MATERIAL REQUIRED

Drawing sheet, cardboard, cellotape, coloured papers, cutter and ruler.

METHOD OF CONSTRUCTION

- 1. Cut out a square of side length *a* units from a drawing sheet/cardboard and name it as square ABCD [see Fig. 1].
- 2. Cut out another square of length *b* units from a drawing sheet/cardboard and name it as square CHGF [see Fig. 2].

- 3. Cut out a rectangle of length *a* units and breadth *b* units from a drawing sheet/cardbaord and name it as a rectangle DCFE [see Fig. 3].
- 4. Cut out another rectangle of length *b* units and breadth *a* units from a drawing sheet/cardboard and name it as a rectangle BIHC [see Fig. 4].

Mathematics

17

5. Total area of these four cut-out figures

= Area of square ABCD + Area of square CHGF + Area of rectangle DCFE + Area of rectangle BIHC

- $= a^2 + b^2 + ab + ba = a^2 + b^2 + 2ab.$
- 6. Join the four quadrilaterals using cello-tape as shown in Fig. 5.

Clearly, AIGE is a square of side (a + b). Therefore, its area is $(a + b)^2$. The combined area of the constituent units $= a^2 + b^2 + ab + ab = a^2 + b^2 + 2ab$. Hence, the algebraic identity $(a + b)^2 = a^2 + 2ab + b^2$

Here, area is in square units.

OBSERVATION

On actual measurement:

 $a = \dots, b = \dots, (a+b) = \dots,$ So, $a^2 = \dots, b^2 = \dots, ab = \dots,$ $(a+b)^2 = \dots, 2ab = \dots,$ Therefore, $(a+b)^2 = a^2 + 2ab + b^2$.

The identity may be verified by taking different values of *a* and *b*.

APPLICATION

The identity may be used for

- 1. calculating the square of a number expressed as the sum of two convenient numbers.
- 2. simplifications/factorisation of some algebraic expressions.

OBJECTIVE

To verify the algebraic identity :

 $(a-b)^2 = a^2 - 2ab + b^2$

MATERIAL REQUIRED

Drawing sheets, cardboard, coloured papers, scissors, ruler and adhesive.

METHOD OF CONSTRUCTION

- 1. Cut out a square ABCD of side *a* units from a drawing sheet/cardboard [see Fig. 1].
- 2. Cut out a square EBHI of side *b* units (*b* < *a*) from a drawing sheet/cardboard [see Fig. 2].
- 3. Cut out a rectangle GDCJ of length *a* units and breadth *b* units from a drawing sheet/cardboard [see Fig. 3].
- 4. Cut out a rectangle IFJH of length *a* units and breadth *b* units from a drawing sheet/cardboard [see Fig. 4].

5. Arrange these cut outs as shown in Fig. 5.

DEMONSTRATION

According to figure 1, 2, 3, and 4, Area of square ABCD = a^2 , Area of square EBHI = b^2

Area of rectangle GDCJ = ab, Area of rectangle IFJH = ab

From Fig. 5, area of square AGFE = AG × GF = $(a - b) (a - b) = (a - b)^2$

Now, area of square AGFE = Area of square ABCD + Area of square EBHI

$$= a2 + b2 - ab - ab$$
$$= a2 - 2ab + b2$$

Here, area is in square units.

Observation

On actual measurement:

 $a = \dots, b = \dots, (a - b) = \dots,$ So, $a^2 = \dots, b^2 = \dots, (a - b)^2 = \dots,$ $ab = \dots, 2ab = \dots$

Therefore, $(a - b)^2 = a^2 - 2ab + b^2$

APPLICATION

The identity may be used for

- 1. calculating the square of a number expressed as a difference of two convenient numbers.
- 2. simplifying/factorisation of some algebraic expressions.

OBJECTIVE

To verify the algebraic identity :

$$a^2 - b^2 = (a + b)(a - b)$$

MATERIAL REQUIRED

Drawing sheets, cardboard, coloured papers, scissors, sketch pen, ruler, transparent sheet and adhesive.

METHOD OF CONSTRUCTION

- 1. Take a cardboard of a convenient size and paste a coloured paper on it.
- 2. Cut out one square ABCD of side *a* units from a drawing sheet [see Fig. 1].
- 3. Cut out one square AEFG of side *b* units (*b* < *a*) from another drawing sheet [see Fig. 2].

- 4. Arrange these squares as shown in Fig. 3.
- 5. Join F to C using sketch pen. Cut out trapeziums congruent to EBCF and GFCD using a transparent sheet and name them as EBCF and GFCD, respectively [see Fig. 4 and Fig. 5].

Fig. 5

 Arrange these trapeziums as shown in Fig. 6.

DEMONSTRATION

Area of square ABCD = a^2

Area of square AEFG = b^2

In Fig. 3,

Area of square ABCD – Area of square AEFG

= Area of trapezium EBCF + Area of trapezium GFCD

= Area of rectangle EBGD [Fig. 6].

= ED \times DG

Thus, $a^2 - b^2 = (a+b) (a-b)$

Here, area is in square units.

Observation

On actual measurement:

 $a = \dots, b = \dots, (a+b) = \dots,$ So, $a^2 = \dots, b^2 = \dots, (a-b) = \dots,$ $a^2-b^2 = \dots, (a+b) (a-b) = \dots,$

Therefore, $a^2-b^2 = (a+b) (a-b)$

APPLICATION

The identity may be used for

- 1. difference of two squares
- 2. some products involving two numbers
- 3. simplification and factorisation of algebraic expressions.

Laboratory Manual

<u>Activity 6</u>

OBJECTIVE

To verify the algebraic identity : $(a+b+c)^2 = a^2 + b^2 + c^2 + 2ab + 2bc + 2ca$

METHOD OF CONSTRUCTION

MATERIAL REQUIRED Hardboard, adhesive, coloured papers, white paper.

- 1. Take a hardboard of a convenient size and paste a white paper on it.
- 2. Cut out a square of side *a* units from a coloured paper [see Fig. 1].
- 3. Cut out a square of side *b* units from a coloured paper [see Fig. 2].
- 4. Cut out a square of side c units from a coloured paper [see Fig. 3].
- 5. Cut out two rectangles of dimensions $a \times b$, two rectangles of dimensions $b \times c$ and two rectangles of dimensions $c \times a$ square units from a coloured paper [see Fig. 4].

Mathematics

6. Arrange the squares and rectangles on the hardboard as shown in Fig. 5.

DEMONSTRATION

From the arrangement of squares and rectangles in Fig. 5, a square ABCD is obtained whose side is (a+b+c) units.

Area of square ABCD = $(a+b+c)^2$.

Therefore, $(a+b+c)^2 = \text{sum of all the}$ squares and rectangles shown in Fig. 1 to Fig. 4.

 $= a^{2} + ab + ac + ab + b^{2} + bc + ac + bc + c^{2}$ $= a^{2} + b^{2} + c^{2} + 2ab + 2bc + 2ca$

Here, area is in square units.

OBSERVATION

On actual measurement:

 $a = \dots, b = \dots, c = \dots,$ So, $a^2 = \dots, b^2 = \dots, c^2 = \dots, ab = \dots,$ $bc = \dots, ca = \dots, 2ab = \dots, 2bc = \dots,$ $2ca = \dots, a+b+c = \dots, (a+b+c)^2 = \dots,$ Therefore, $(a+b+c)^2 = a^2 + b^2 + c^2 + 2ab + 2bc + 2ca$

APPLICATION

The identity may be used for

- 1. simiplification/factorisation of algebraic expressions
- 2. calculating the square of a number expressed as a sum of three convenient numbers.

Laboratory Manual

Fig. 5

OBJECTIVE

To verify the algebraic identity :

 $(a+b)^3 = a^3 + b^3 + 3a^2b + 3ab^2$

METHOD OF CONSTRUCTION

MATERIAL REQUIRED

Acrylic sheet, coloured papers, glazed papers, saw, sketch pen, adhesive, Cello-tape.

- 1. Make a cube of side *a* units and one more cube of side *b* units (*b* < *a*), using acrylic sheet and cello-tape/adhesive [see Fig. 1 and Fig. 2].
- 2. Similarly, make three cuboids of dimensions $a \times a \times b$ and three cuboids of dimensions $a \times b \times b$ [see Fig. 3 and Fig. 4].

Fig. 4

3. Arrange the cubes and cuboids as shown in Fig. 5.

Fig. 5

DEMONSTRATION

Volume of the cube of side $a = a \times a \times a = a^3$, volume of the cube of side $b = b^3$ Volume of the cuboid of dimensions $a \times a \times b = a^2b$, volume of three such cuboids $= 3a^2b$

Volume of the cuboid of dimensions $a \times b \times b = ab^2$, volume of three such cuboids $= 3ab^2$

Solid figure obtained in Fig. 5 is a cube of side (a + b)

Its volume = $(a + b)^3$

Therefore, $(a+b)^3 = a^3 + b^3 + 3a^2b + 3ab^2$

Here, volume is in cubic units.

OBSERVATION

On actual measurement:

 $a = \dots, b = \dots, a^3 = \dots,$ So, $a^3 = \dots, b^3 = \dots, a^2b = \dots, 3a^2b = \dots,$ $ab^2 = \dots, 3ab^2 = \dots, (a+b)^3 = \dots,$ Therefore, $(a+b)^3 = a^3 + b^3 + 3a^2b + 3ab^2$

APPLICATION

The identity may be used for

- 1. calculating cube of a number expressed as the sum of two convenient numbers
- 2. simplification and factorisation of algebraic expressions.

OBJECTIVE

To verify the algebraic identity

 $(a - b)^3 = a^3 - b^3 - 3(a - b)ab$

MATERIAL REQUIRED

Acrylic sheet, coloured papers, saw, sketch pens, adhesive, Cellotape.

METHOD OF CONSTRUCTION

- 1. Make a cube of side (a b) units (a > b)using acrylic sheet and cellotape/ adhesive [see Fig. 1].
- 2. Make three cuboids each of dimensions $(a-b) \times a \times b$ and one cube of side *b* units using acrylic sheet and cellotape [see Fig. 2 and Fig. 3].
- 3. Arrange the cubes and cuboids as shown in Fig. 4.

Fig. 4

DEMONSTRATION

Volume of the cube of side (a - b) units in Fig. $1 = (a - b)^3$ Volume of a cuboid in Fig. 2 = (a - b) abVolume of three cuboids in Fig. 2 = 3 (a - b) abVolume of the cube of side b in Fig. $3 = b^3$ Volume of the solid in Fig. $4 = (a - b)^3 + (a - b) ab + (a - b) ab + b^3$ $= (a - b)^3 + 3(a - b) ab + b^3$ (1) Also, the solid obtained in Fig. 4 is a cube of side a Therefore, its volume $= a^3$ (2) From (1) and (2), $(a - b)^3 + 3(a - b) ab + b^3 = a^3$ or $(a - b)^3 = a^3 - b^3 - 3ab (a - b)$.

Here, volume is in cubic units.

Mathematics

OBSERVATION

On actual measurement:

 $a = \dots, b = \dots, a-b = \dots,$ So, $a^3 = \dots, ab = \dots, b^3 = \dots, ab(a-b) = \dots, 3ab(a-b) = \dots, (a-b)^3 = \dots, Therefore, <math>(a-b)^3 = a^3 - b^3 - 3ab(a-b)$

APPLICATION

The identity may be used for

- 1. calculating cube of a number expressed as a difference of two convenient numbers
- 2. simplification and factorisation of algebraic expressions.

This	identity	can	also	be
expressed as :				
$(a-b)^3 = a^3 - 3a^2b + 3ab^2 - b^3.$				

Note

OBJECTIVE

To verify the algebraic identity :

 $a^3 + b^3 = (a + b) (a^2 - ab + b^2)$

MATERIAL REQUIRED

Acrylic sheet, glazed papers, saw, adhesive, cellotape, coloured papers, sketch pen, etc.

- METHOD OF CONSTRUCTION
 - 1. Make a cube of side *a* units and another cube of side *b* units as shown in Fig. 1 and Fig. 2 by using acrylic sheet and cellotape/adhesive.
 - 2. Make a cuboid of dimensions $a \times a \times b$ [see Fig. 3]. 3. Make a cuboid of dimensions $a \times b \times b$ [see Fig. 4]. 4. Arrange these cubes and cuboids as shown in Fig. 5. Fig. 2 Fig. 3 Fig. 1 Fig. 4Fig. 5

DEMONSTRATION

Volume of cube in Fig. $1 = a^3$ Volume of cube in Fig. $2 = b^3$ Volume of cuboid in Fig. $3 = a^2b$ Volume of cuboid in Fig. $4 = ab^2$ Volume of solid in Fig. $5 = a^3+b^3+a^2b+ab^2$ $= (a+b) (a^2 + b^2)$ Removing cuboids of volumes a^2b and ab^2 , i.e., ab (a + b) from solid obtained in Fig. 5, we get the solid in Fig. 6.

Volume of solid in Fig. $6 = a^3 + b^3$.

Therefore, $a^3 + b^3 = (a+b)(a^2 + b^2) - ab(a+b)$ = $(a+b)(a^2 + b^2 - ab)$

Here, volumes are in cubic units.

OBSERVATION

On actual measurement:

 $a = \dots, b = \dots,$ So, $a^3 = \dots, b^3 = \dots, (a+b) = \dots, (a+b)a^2 = \dots,$ $(a+b)b^2 = \dots, a^2b = \dots, ab^2 = \dots,$ $ab(a+b) = \dots,$ Therefore, $a^3 + b^3 = (a + b)(a^2 + b^2 - ab).$

APPLICATION

The identity may be used in simplification and factorisation of algebraic expressions.

OBJECTIVE

To verify the algebraic identity :

$$a^3 - b^3 = (a - b)(a^2 + ab + b^2)$$

METHOD OF CONSTRUCTION

MATERIAL REQUIRED

Acrylic sheet, sketch pen, glazed papers, scissors, adhesive, cellotape, coloured papers, cutter.

- 1. Make a cuboid of dimensions $(a-b) \times a \times a$ (b < a), using acrylic sheet and cellotape/adhesive as shown in Fig. 1.
- 2. Make another cuboid of dimensions $(a-b) \times a \times b$, using acrylic sheet and cellotape/adhesive as shown in Fig. 2.
- 3. Make one more cuboid of dimensions $(a-b) \times b \times b$ as shown in Fig. 3.
- 4. Make a cube of dimensions $b \times b \times b$ using acrylic sheet as shown in Fig. 4.

Mathematics

5. Arrange the cubes and cuboids made above in Steps (1), (2), (3) and (4) to obtain a solid as shown in Fig. 5, which is a cube of volume a^3 cubic units.

DEMONSTRATION

Volume of cuboid in Fig. $1 = (a-b) \times a \times a$ cubic units.

Volume of cuboid in Fig. $2 = (a-b) \times a \times b$ cubic units.

Volume of cuboid in Fig. $3 = (a-b) \times b \times b$ cubic units.

Volume of cube in Fig. $4 = b^3$ cubic units.

Volume of solid in Fig. $5 = a^3$ cubic units.

Removing a cube of size b^3 cubic units from the solid in Fig. 5, we obtain a solid as shown in Fig. 6.

Volume of solid in Fig. 6 = $(a-b) a^2 + (a-b) ab + (a-b) b^2$

$$= (a-b)(a^2 + ab + b^2)$$

Therefore, $a^3 - b^3 = (a - b)(a^2 + ab + b^2)$

Observation

On actual measurement:

 $a = \dots, b = \dots,$ So, $a^3 = \dots, b^3 = \dots, (a-b) = \dots, ab = \dots,$ $a^2 = \dots, b^2 = \dots,$ Therefore, $a^3 - b^3 = (a - b) (a^2 + ab + b^2).$

APPLICATION

The identity may be used in simplification/factorisation of algebraic expressions.
