Q30 The concept of 'wave nature of matter' was postulated by de Broglie in 1924. It was confirmed experimentally by Davisson and Germer a few years after its postulation. Therefore, the realization was that 'wave nature' and 'particle nature' can be viewed as the 'two sides of a coin'. Both matter and radiation can exhibit either of these 'natures', depending on the experimental situation. The phenomena of photoelectric effect and the concept of 'matter waves', have been put to very useful and interesting practical applications. We are aware of photocells, automatic doors at shops and malls, automatic light switches that turn on the lights as soon as the intensity drops.

29.	Temperature has a marked effect on the rate of reaction. For most of the reactions, the rate of reaction becomes nearly double for every 10 degrees rise in temperature. The effect of temperature is usually expressed in terms of temperature coefficient. The quantitative dependence of reaction rate on temperature was first explained by Swante Arrhenius. Arrhenius proposed a simple equation known as Arrhenius equation $k = Ae^{-E_a/RT}$. This equation provides a relationship between the rate constant (k) of a reaction and the temperature of the system. A is the Arrhenius factor or pre-exponential factor, E_a is the activation energy and R is the gas constant. According to Boltzmann and Maxwell, the distribution of kinetic energy may be described by plotting the fraction of molecules with a given kinetic energy. The Maxwell-Boltzmann Distribution is important in chemical reactions because it helps to explain the rate of reaction. The speed of particles affects the rate of collision between particles, which in turn affects the rate of reaction and also shows the distribution of energy amongst the particles of an ideal gas. Answer the following questions: (i) Define ‘activation energy’ of a reaction. (ii) What is the expression for the fraction of molecules having energy greater than activation energy? OR How does a catalyst affect the rate of a reaction? Explain with respect to the Arrhenius equation. (iii) Can a reaction have zero activation energy? Justify	1 1 2
30.	Pure aliphatic and alkyl amines can be prepared by Gabriel phthalimide reaction. In this reaction, phthalimide is treated with ethanolic KOH solution followed by heating with a suitable alkyl or aralkyl halide to give N-substituted phthalimides. These upon hydrolysis with dil HCl under pressure give primary amines. Primary amines can also be prepared from amides by treatment with Br_2 and KOH by a reaction known as Hoffmann bromamide degradation method. Like ammonia, amines behave as Lewis bases because of the presence of a lone pair of electrons. The basicity	

	of aliphatic amines in aqueous solution depends upon the +I effect of alkyl group as well as the extent of hydrogen bonding with water molecules and the steric effect of the alkyl group. However, aromatic amines are weaker bases than aliphatic amines. Primary amines with three or more carbon atoms are liquid and still higher ones are solid. Aniline and other aryl amines are usually colourless but get coloured on storage due to atmospheric oxidation. Answer the following questions: i) How can you distinguish between $\text{CH}_3\text{CH}_2\text{NH}_2$ and $(\text{CH}_3\text{CH}_2)_2\text{NH}$ by Hinsberg test? ii) Which one has more pK_b value; aliphatic amines or ammonia? 	दुःख के वर्ग में जो स्थान भय का है, वही स्थान आनंद-वर्ग में उत्साह का है। भय में हम प्रस्तुत कठिन स्थिति के नियम से विशेष रूप में दुःखी और कभी-कभी उस स्थिति से अपने को दूर रखने के लिए प्रयत्नवान भी होते हैं। उत्साह में हम आने वाली कठिन स्थिति के भीतर साहस के अवसर के निश्चय द्वारा प्रस्तुत कर्म-सुख की उमंग से अवश्य प्रयत्नवान होते हैं। उत्साह से कष्ट या हानि सहने की दृढ़ता के साथ-साथ कर्म में प्रवृत्ति होने के आनंद का योग रहता है। साहसपूर्ण आनंद की उमंग का नाम उत्साह है। कर्म-सौंदर्य के उपासक ही सच्चे उत्साही कहलाते हैं। जिन कर्मों में किसी प्रकार कष्ट या हानि सहने का साहस अपेक्षित होता है उन सबके प्रति उत्कंठापूर्ण आनंद उत्साह के अंतर्गत लिया जाता है। कष्ट या हानि के भेद के अनुसार उत्साह के भी भेद हो जाते हैं। साहित्य-मीमांसकों ने इसी दृष्टि से युद्ध-वीर, दान-वीर, दया-वीर इत्यादि भेद किए हैं। इनमें सबसे प्राचीन और प्रधान युद्धवीरता है, जिसमें आघात, पीड़ा क्या मृत्यु तक की परवाह नहीं	

	रहती। इस प्रकार की वीरता का प्रयोजन अत्यंत प्राचीन काल से पड़ता चला आ रहा है, जिसमें साहस और प्रयत्न दोनों चरम उत्कर्ष पर पहुँचते हैं। केवल कष्ट या पीड़ा सहन करने से साहस में ही उत्साह का स्वरूप स्फुरित नहीं होता। उसके साथ आनंदपूर्ण प्रयत्न या उसकी उत्कंठा का योग चाहिए। बिना बेहोश हुए भारी फोड़ा चिराने को तैयार होना साहस कहा जाएगा, पर उत्साह नहीं। इसी प्रकार चुपचाप, बिना हाथ-पैर हिलाए, घोर प्रहार सहने के लिए तैयार रहना साहस और कठिन-से-कठिन प्रहार सहकर भी जगह से न हटना वीरता कही जाएगी। ऐसे साहस और वीरता को उत्साह के अंतर्गत तभी ले सकते हैं जब कि साहसी या वीर उस काम को आनंद के साथ करता चला जाएगा जिसके कारण उसे इतने प्रहार सहने पड़ते हैं। सारांश यह है कि आनंदपूर्ण प्रयत्न या उसकी उत्कंठा में ही उत्साह का दर्शन होता है, केवल कष्ट सहने के निश्चेष्ट साहस में नहीं। वृत्ति और साहस दोनों का उत्साह के बीच संचरण होता है। दानवीर और अर्थ-त्याग का साहस अर्थात् उसके कारण होने वाले कष्ट या कठिनता को सहने की क्षमता अंतर्निहित रहती है। दानवीरता तभी कही जाएगी जब दान के कारण दानी को अपने जीवन-निर्वाह में किसी प्रकार का कष्ट या कठिनता दिखाई देगी। इस कष्ट या कठिनता की मात्रा या संभावना जितनी ही अधिक होगी, दानवीरता उतनी ही ऊँची समझी जाएगी, पर इस अर्थ-त्याग के साहस के साथ ही जब तक पूर्ण तत्परता और आनंद के चिह्न न दिखाई पड़ेंगे तब तक उत्साह का स्वरूप न खड़ा होगा।

READING SKILLS**

(22 marks)

Q1. Read the following passage carefully and answer the questions that follow:

12 Marks

1) What were once upon a time seen in millions throughout the country, are today seen only in certain pockets of India? House sparrows. Why so? Conclusively, there have been no studies to identify the exact cause behind the sudden decrease in their numbers, but studies conducted in Jharkhand, India have pegged the decrease in sparrow count to be an alarming 80%. And lest you may assume, this is not limited to India alone!

2) There are a variety of reasons behind the declining sparrow count; with some pointing fingers at the architecture of modern houses which leaves little space for nesting sites. Add to it the decrease in shrub vegetation areas as well and the result is drastic loss in habitat. Excessive use of pesticides in agriculture is another cause, as it causes a decrease in reproductive efficiency of the sparrows by infecting their egg sheaths and its diet, since the chief diet of the sparrows is seeds, cereals and insects which in turn are direct victims of pesticide usage.

3) Sparrows are known to be sedentary birds that usually do not prefer undertaking long flights. However, with the advent of mobile telephony and the corresponding erection of mobile towers any and everywhere has made the sparrows an unwitting prey to technology. Mobile towers are known to emit radiation in the frequency of 900 to 1800 MHz which not only harms the thin chick skull and sparrow eggs, but also confuses and disorients the sparrow's navigational skills. Sparrows are rarely, or rather never found in areas having mobile towers.

4) The Nature Forever Society (NFS) was founded by an Indian conservationist Mohammed Dilawar. He started his work helping the house sparrows in Nasik. Emphasizing the crying need to conserve house sparrows, Dilawar said, "The indifference caused by the lack of emotional connect has pushed these birds to the edge of extinction."

5) The NFS started an international initiative to celebrate World Sparrow Day. This was first celebrated on 20 March 2010. After that, every year this day was celebrated all over the world to raise awareness about house sparrows and other common birds affected by the environment. In 2012, the sparrow was adopted as the state bird of Delhi.

Q2. Read the following passage carefully and answer the questions that follow:

The idea that coffee is bad for the heart pops up periodically. It was found that regularly drinking very strong coffee could sharply increase cholesterol levels. Researchers find that isolated fat like chemicals, cafestol and kahweol are responsible for the rise.

It turned out that the European brewing method- boiling water sits on the coffee grounds for several minutes before straining- produces high concentrations of cafestol and kahweol. By contrast, the filter and percolation methods remove all but a trace of these chemicals. Moreover, the studies involved large amounts of coffee, 5-6 cups a day. Research also shows that regular moderate coffee drinking does not dangerously raise blood pressure.

“For heart disease, I think, the issue is closed.” -says Meir Stampfer an epidemiologist at Harvard who has studied many aspects of coffee and health. —Coffee drinking at reasonable levels is unrelated to heart risk.” Evidence suggests that coffee may help fend off Parkinson’s disease.

Scientists at Massachusetts general hospital, USA, found indirect evidence that caffeine may actually combat Parkinson’s. The caffeine seemed to protect mice brain cells from depletion of the nerve chemical dopamine- the problem underlying Parkinson’s in humans. However, these are preliminary findings, human studies have not consistently supported caffeine’s protective role.

The studies on coffee and cancer are also reassuring. You may remember a brief coffee scare in the early 1980’s when a single study linked coffee with pancreatic cancer. Many studies since then have shown that the association is either extremely weak or non-existent. If there is a connection between coffee and bladder cancer, it possibly just applies to coffee junkies. Studies show that coffee seems to have no adverse influence on the risk of colon cancer.

Caffeine is such a powerful stimulant that the international Olympic committee and the National Collegiate Athletic Association set limits on how much can remain in the blood during competition. In addition to boosting physical endurance, caffeine increases alertness and improves mood. The buzz comes at a price though.

People who drink more than they are used to may become restless and unable to sleep. The question now arises; how much to drink? For most people, however, there is virtually no risk in consuming up to 3 normal cups a day. For healthy adults, the FDA has cited 400 mg a day- that’s about 4 or 5 cups of coffee- as an amount not generally associated with dangerous negative effects. The FDA has not set consumption of caffeine by children and adolescents.

The amount of caffeine included in some common food and beverages are:

- One 8-ounce cup of coffee; 95-200mg
- One 12-ounce can of cola; 35-45mg
- One 8-ounce energy drink; 70-150mg
- One 8-ounce cup of tea; 14-60mg

Based on your understanding of the passage answer the questions by choosing the correct option.
